2025 DIRECTOR'S EXECUTIVE SUMMARY

In 2025, the National MagLab served users from across the country, including many students and first-time researchers, delivering exceptionally high satisfaction scores and reliable magnet time. Across the lab's seven user facilities, major upgrades were made to improve the user experience - magnet protection and infrastructure upgrades, new EMR and NMR capabilities, expanded FTICR tools, and progress toward returning the 1.4GW motor generator to service. Researchers published more than 400 peer-reviewed papers with breakthrough findings in quantum materials, superconductivity, biology/enzymes, and advanced measurement methods. The Lab also strengthened STEM workforce efforts through thousands of K12 engagements, camps, and conferences, and worked with companies to advance high magnetic field impact in the U.S.

THE NSF-FUNDED MAGLAB USER PROGRAM

The MagLab continued to provide scientists with access to the world's highest magnetic field research environments in 2025. About 1,635 researchers, students, and technicians conducted experiments across the lab in 2025, using our powerful magnets to advance society's understanding of new materials, energy solutions, the environment, and the science that underlies life.

The National MagLab's user community included researchers from 302 universities, government labs, or companies using the facility to investigate interdisciplinary questions that span the scientific spectrum – from physics to biology, chemistry to engineering. Of the more than 1630 users, about 24% were new to the MagLab user facility that they accessed to conduct their research. About 51% of the lab's 2025 user community were students and postdocs.

National MagLab users remained exceptionally positive about their user experience in 2025. A user survey conducted in June shows their overwhelming satisfaction:

- 97% external users are satisfied with the performance of the facilities and equipment
- 96% external users are satisfied with the assistance provided by technical staff
- 97% external users are satisfied with the proposal process.

Across the National MagLab's seven user facilities, enhancements and upgrades were made in 2025 that improved the user experience and experimental environment, or maintained the key assets of the lab. Featured enhancements included:

- The 3.2mm e-free MAS probe available to the AMRIS user program on the 800MHz 63mm system received further upgrades with swappable "tuning cards" allowing for a wide range of nuclei to be studied.
- Continued updates to the AMRIS acquisition and processing software have greatly improved AI-based processing of NMR data and allow for more automated batch processing.
- Completed the multi-year rollout of resistive magnet protection systems (RMPS II) across key DCFF magnet cells, boosting operational reliability and user safety (less downtime, longer magnet life, and uninterrupted delivery of world-class magnetic fields for scientific research).
- In 2025, the DC Field Facility completed and commissioned a significant multi-year upgrade to its magnet cooling water system, enhancing both capacity and resilience. The new system now has two *equivalent* cooling loops, each capable of moving 4,500 gallons per minute, supported by four 500HP pumps and two high-capacity pumps rated at 800HP and 900HP—all equipped with variable speed drives, increasing capacity and resilience, and enabling future expansion, including parallel operation of two 36MW magnets.
- In 2025, the DC Field Facility recommissioned its portable dilution refrigerator for use in Cell 8 (35T, 32mm bore), selected to maximize the noise reduction potential for demanding low-electron-temperature measurements.
- EMR brought two magnet systems online in 2025, providing a higher magnetic field with the absence of a superconducting switch, allowing a higher field sweep rate, double what was possible previously. This enables more efficient data collection with decreased helium consumption.
- Added a new high-power amplifier and ultrafast optical switch, enabling longer, more flexible experiments and cleaner measurements (less downtime/noise) for EMR users.

- Also in 2025, the EMR facility's state-of-the-art Bruker X-/Q-band (9/34GHz) pulsed EPR spectrometer with many advanced features, such as in situ optical and nuclear excitation for double resonance investigations, came online.
- Upgraded a key EMR spectrometer with new pulse control electronics and a more powerful source—unlocking faster, sharper measurements and opening up new types of experiments for users.
- In 2025, a new ICR spectrometer was acquired that includes trapped ion mobility spectrometry (TIMS) for rapid gas-phase separation of, e.g., isomeric molecules with identical molecular weight. This acquisition brought the number of FT-ICR mass spectrometers available to the user program to four.
- Three-way parallelization of the linear ion trap, orbitrap, and ICR mass analyzers was demonstrated on the 14.5T and 21T instruments in the ICR Facility in 2025, a unique capability for structural determination.
- ICR also implemented an automated method for acquisition of direct infusion electrospray data. This method, termed DIADEM, has allowed thousands of spectra to be collected during 24-7 operation of the 21T ICR and is now being combined with automated data processing.
- About a dozen upgrades to NMR probes were made in 2025, including a 3.2mm and 2.5mm HX MAS low-E probe for material and biosolid applications on the 850MHz; a 2.5mm HX MAS probe for the 800MHz capable spinning up to 29kHz MAS, expanding the range of observable isotopes to cover 80% of NMR-active nuclides in the periodic table; a 3.2mm HXY low-temperature (100K) DNP MAS probe expanding the array of covered X-Y isotope combinations with new 3-resonance tune cards, per users' demands.
- NMR also saw the development of dual-resonant birdcage volume coils in $^{1}H/^{2}H$ and $^{1}H/^{31}P$ configurations, a ^{1}H quadrature surface coil for mouse Alzheimer's studies, and cost-effective RF shield development for ultra-high field MRI coils on the 900MHz in 2025.
- Expanded NMR capabilities with two donated magnets (a 600MHz wide-bore Agilent magnet obtained from the University of Central Florida, and a 400MHz Bruker magnet was donated by Sanford Burnham).
- In 2025, the effort to return the Pulsed Field Facility's 1.4GW LANL motor generator to service reached major milestones, including bringing fabrication of a replacement rotor to 95% completion (June 2025). In parallel, the power delivery team advanced critical subsystem upgrades—installing new power electronics (generator drive and exciter), expanding sensors and instrumentation for improved health monitoring, and completing inspection/maintenance of the rectification control system—while also finishing a major multiyear open-loop cooling system replacement project vital to generator operation and helium recovery.
- Installation of all hardware and power infrastructure required for the operation of the 85T duplex new magnet at the Pulsed Field Facility is now complete. Separate pulsed power to the insert and outsert magnets, separately, has been successfully delivered.

USER RESEARCH

More than 410 articles appeared in peer-reviewed scientific and engineering journals, more than 40% of which were published in significant journals like *Science, Nature, Physical Review Letters, Energy & Fuels, Analytical Chemistry,* and the *Proceedings of the National Academy of Sciences*. A complete database of user publications can be found at https://nationalmaglab.org/research/publications-all/peer-reviewed-publications. Key discoveries from 2025 included:

- AMRIS users performed the first mechanistic study of tetraisoquinene biosynthesis by TiqS, a diterpene synthase from the myxobacterium *Melittangium boletus*. This work explained how an enzyme helps build a complex natural molecule called a terpene. The researchers worked out key steps in the enzyme's "assembly process," including how it avoids unstable intermediate steps and reliably produces one specific final molecule with an unusual four-ring structure. These findings improve our basic understanding of how nature makes such compounds and could help scientists redesign similar enzymes to create new molecules useful in medicine or agriculture.
- DC Field users discovered that the kagome superconductor CsV_3Sb_3 hosts not one but two distinct superconducting states. Unlike in any other known material, these states coexist without merging into a single phase. This surprising "double" superconductivity challenges long-standing theories

and opens the door to new insights into how quantum materials can carry electricity without resistance.

- Scientists using the DC Field Facility found that an electrical insulator, YbB_{12}, contains hidden particles that respond to magnetic fields even though they carry no electric charge. These “neutral fermions” revealed themselves through tiny ripples in the heat capacity when the material was placed in very strong magnetic fields.
- DC Field users detected semi-Dirac fermions, a unique type of particle predicted 16 years ago, but never observed. These particles are massless in one direction and have mass in the perpendicular direction. Using high-field magneto-infrared spectroscopy, they found clear evidence of the fermions in zirconium silicon sulfide (ZrSiS) when exposed to strong magnetic fields and observed a distinct energy pattern that matches the predicted signature of semi-Dirac fermions (cyclotron energy scales with the two-thirds power of the magnetic field).
- EMR users discovered that a special arrangement of europium ions connected by organic molecules could be ideal for efficient magnetic cooling at extremely low temperatures. The triangular pattern prevents the europium ions from settling into an ordered magnetic state, keeping them disordered even at near absolute zero. This unique property makes the material promising for advanced cooling technologies.
- Researchers performed high-field electron paramagnetic resonance measurements on titanium-based catalyst molecules at the MagLab EMR facility and found small, but distinct differences indicating subtle variations in electronic structure. Changes in electronic structure can relate to effectiveness in producing polymers like plastics.
- In a series of experiments at High B/T Using the MagLab’s newest ultra-cold, highfield- setup, researchers uncovered *two distinct “drag” effects* in paired quantum wires—an unexpected clue to how electrons interact in nextgeneration- quantum materials, and a key step toward designing future ultra-efficient nanoelectronics and quantum technologies.
- Using the 21T ICR-MS, ICR users performed molecular composition analysis for a variety of highly complex samples from soils, lake sediment, river, ocean, and glacial waters, to tropical tree roots, and pyrolysis oils. 21T nESI data from solid phase extracted glacial water samples and surface ice revealed how anthropogenic carbon is deposited and exported from glaciers in the Arctic and Antarctic. Data from extracted Amazon basin river samples over 8 years revealed seasonal changes in the delivery of dissolved organic matter to the ocean and an additional contribution of ~5 %.
- Using a custom chemical separation process, ICR users were able to isolate and detect nearly twice as many molecules in bio-oils compared to traditional techniques. This novel approach revealed previously hidden isomers - molecules with the same numbers and types of atoms but arranged in different structures –that are not invisible using conventional techniques.
- MagLab data collected with the 21 tesla FT-ICR mass spectrometer demonstrate the risk associated with internal fragment annotation in mass spectra of intact proteins. These findings will enhance the integrity of top-down proteomics data and prevent misidentification of proteins involved in biological phenotypes of interest.
- Scientists used the world’s strongest NMR magnet to study how magnesium ions (^{25}Mg) move inside special materials called antiperovskites. The ultra-high magnetic field allowed researchers to perform variable-temperature solid-state nuclear magnetic resonance (SSNMR) to measure magnesium’s motion in detail for the first time, finding low-energy pathways.
- Scientists have shown that ultra-wide-line solid-state NMR can be used to directly study bismuth (^{209}Bi) and iodine (^{127}I) atoms inside metal-organic frameworks (MOFs) — a special type of material with tiny pores that can trap and store gases, speed up chemical reactions, store energies, or deliver medicines. This breakthrough was made possible by using ultra-high magnetic fields up to 35.2 tesla, enabling high-resolution measurements that were previously out of reach.
- NMR users discovered that the molecules that make up cartilage — particularly highly mobile glycosaminoglycans GAGs and collagen (a structural protein that provides strength, flexibility, and support to connective tissues) — are held together by specific electrostatic and hydrogen bonding interactions. This is the first time these connections have been directly observed at the atomic level in natural cartilage.

- In magnetic fields up to 70T at the Pulsed Field Facility, MagLab users found a surprising new kind of superconductivity in nickelate materials—showing they can *keep carrying electricity with no resistance even when intense fields should shut superconductivity down*, a discovery that could point to future superconductors that work in far harsher conditions. Measurements of $Sm_{1-x-y-z}Eu_xCa_ySr_zNiO_2$ demonstrate clear magnetic-field-induced re-entrant superconductivity and extraordinarily large upper critical fields and constitute the first observation of magnetic-field-induced or re-entrant superconductivity in a high-temperature superconductor. The 60T Mid-pulse and 75T Duplex magnets at the PFF, coupled with steady state measurements in the 41T resistive magnet and 45T hybrid magnet at the DC facility, played vital roles in these results, enabling users to induce re-entrant superconducting phases and track their evolution with angle of applied field and temperature.
- Studying h-$Lu_{0.9}Er_{0.1}MnO3$, users of the PFF revealed an unusual light control effect relevant for optical communications through optical fibers. High magnetic field magneto-optical measurements up to 55T were essential for mapping out the response as a function of wavelength, revealing strong field-dependent shifts and demonstrating robust magnetoelectric coupling at high fields.
- Using ultrahigh pulsed magnetic fields, researchers observed the “Yamaji effect” at unusually high temperatures—an exciting advance that reveals new details of how electrons move in quantum materials and underscores the unique reliability of the MagLab’s 75T Duplex magnet.
- The MagLab is partnering with researchers at the Cornell High Energy Synchrotron Source (CHESS) to implement FOXDEN (1) — their FAIR Open-Science Extensible Data Exchange Network. This software helps manage, discover, and track data and metadata that are Findable, Accessible, Interoperable, and Reusable (FAIR). By using emerging metadata standards like Science-on-schema.org (2) and Croissant (3), the system improves data discoverability and makes it easier to apply artificial intelligence (AI) techniques.

More 2025 MagLab science highlights can be found online at https://nationalmaglab.org/research/science-highlights/ as well as information on our in-house research efforts in condensed matter physics, cryogenics, geochemistry and biology/chemistry.

MAGNET-MAKING MILESTONES

Magnet technology is a critical component of the MagLab, advanced in the lab’s Applied Superconductivity Center (ASC) and the Magnet Science and Technology (MS&T) division. ASC is focused on developing superconducting materials and magnet technologies, from initial materials research to feasibility validations, while MS&T works to develop and maintain high-field magnet systems. Key achievements and technical research highlights during 2025 include -

- In 2025, ASC commissioned the large “Renegade” over-pressure furnace and upgraded the “Deltech” furnace with more robust heater technology, while expanding the Bi-2212 melt-phase uniform-temperature zone (±2°C above 872°C). The Renegade achieved >0.5m uniform zone at 50 bar (via extended ramping), and studies identified a pathway to ~1m uniform zone at ~20–25 bar—a key step toward 1m demonstrator magnets.
- 2025 saw world-record high-field progress using the “Little Big Coil” REBCO testbed at ASC with the world’s first conductor characterization up to 45T for LBC tapes and increased throughput to four LBC tests per year through fabrication/modularization improvements. Little Big Coils twice surpassed the prior 45.5T DC field record, reaching 46.0T and a new world record of 48.7T in 2025.
- Bi-2212 coil technology advanced toward higher-field, higher-stress operation in 2025, ASC pursued a two-pronged conductor- and coil-level reinforcement strategy and began preparing a new series of coils targeting 20T+ performance in 2026 (including a projected 21.4T combined field at 350A) while also launching test coils aimed at exploring >>400 MPa stress regimes to enable future 30T-class systems.
- In 2025, ASC provided extensive superconducting and microstructural characterization to support efforts to establish US-based REBCO coated conductor manufacturing, linking nanostructure (e.g., Y_2O_3 precipitates/defects) to performance and giving feedback that “significantly contributed” to high temperature superconducting production R&D.
- In 2025, a rewound CORC® cable solenoid survived extensive mechanical/thermal cycling, including 99 operating current cycles to ~230MPa JBr hoop stress, 14 quenches, and 5 thermal

cycles; follow-up tests showed no loss in critical current (with an 18% n-value drop indicating changed current sharing), supporting continued high-stress testing plans.

- MS&T sustained their world-leading DC magnet resistive magnet suite running reliably in 2025, with the 41.5T all-resistive magnet remaining the facility's most-used system (including continued long-life coil performance). The team completed 30+ major maintenance actions and produced four spare resistive coils, including a redesigned 41.5T D-spare coil expected to improve coil longevity by reducing current density while maintaining field strength.
- Design for a 22.5T / 195mm Large Bore Resistive Magnet was advanced in 2025 to the point that construction can begin, establishing a key testbed for future 50–60T HTS insert development.
- Fabrication was completed in 2025 for a 60T Controlled Waveform system Coil 7, including full winding, impregnation, testing, and shipment preparation for delivery to the pulsed-field operations group at LANL.
- The 40T All Superconducting magnet project saw advancements in 2025 including a user DC field and Pulsed field user survey to prioritize high-impact experimental capabilities and techniques to maximize the scientific impact of the future 40T magnet; a second round test of Large Scale Coil 1 was successfully performed in October 2025 marking the successful completion of the preliminary design. Future tests of a Large Scale Coil 2 are planned for the coming year as work toward a 40T magnet final design nears completion. This magnet is currently designed to feature a 12T LTS outsert combined with the 28T HTS coils to reach a total field of 40T. The initial specification for the commercial LTS magnet was released to vendors as a Request for Information (RFI) for the 40T construction proposal and two vendors responded with conceptual designs and estimated budget and schedule.

STEM WORKFORCE & PARTNERING WITH INDUSTRY FOR BROADER IMPACT

Work to broaden the US-based STEM workforce continued in 2025 at the MagLab. At the K-12 level, more than 2,000 students from 45 schools came to the MagLab for an educational fieldtrip. Six Science Night events were held in 2025 at the Public Library and were attended by approximately 500 preschool and elementary-aged kids and their parents. Over 90% of kid participants leave feeling that science is fun, and more than 90% of parent participants say they also learned something at Science Night.

Nearly 70 middle and high school students participated in camps or internship programs at the lab. Participants report having engaged in hands-on STEM activities and meaningful interactions with STEM professionals, which increased their interest in science and fostered a strong sense of belonging and STEM identity; an increased understanding of science, and greater confidence in engaging with scientific activities. In 2025, LANL Pulse Field Facility members participated in the 9th annual Los Alamos National Laboratory Summer Physics Camp. The free camp for about 30 middle and high school students from across New Mexico aims to empower students to consider careers in science, technology, engineering, and math (STEM).

Another 26 undergraduates participated in Research Experiences for Undergrads or Magnetic Momentum Scholars Program. Participants show growth in skill development, positive perception of STEM careers and connection with potential STEM mentors and/or peers.

A Research Experiences for Teachers (RET) program hosted ten teachers in 2025, all from Title 1 schools. Evaluation data shows that the RET program significantly strengthened teachers' knowledge, confidence, and instructional practices, with both in-person and virtual sessions contributing to sustained engagement and effective application of MagLab science in the classroom.

In 2025, MagLab staff gave 146 lectures, talks and presentations to organizations around the country and the world. In 2025, the MagLab hosted ten conferences and workshops reaching close to 450 people, including the 14th North American FTMS Conference, which attracted top scholars in the ICR field, and the Annual DC Field Facility MagLab User Summer School, which hosted 17 participants for an immersive program designed to train the next generation of scientists in high magnetic field research.

The 2025 MagLab Open House hosted 10,000 people who came to celebrate the launch of a new era of the MagLab following our lab's 30th anniversary. Survey data shows that about half of 2025 Open House visitors had never been to the lab before the event and that about 90% agreed or strongly agreed that the event helped them better understand the science at the MagLab and how it benefits our community. Another 1,500 people engaged with MagLab UF facilities at a STEM ON THE LAWN event.

The MagLab helped host a national Motor Drives and Magnetic Systems Conference in Tallahassee in 2025 for about 250 attendees, many from leading magnet companies. In addition, the lab engaged with

dozens of companies in 2025, growing our broad partnership network across quantum, superconductivity, rare earth extraction and magnet technology domains.

SECURING A HEALTHY, SAFE, POSITIVE & PRODUCTIVE LAB ENVIRONMENT

The MagLab partnered with its host institutions to protect users, employees, visitors and the community, investing $70,000 in 2025 in safety equipment, supplies, security upgrades, training, and education (including PPE; Lockout/Tagout and controlled energy verification; gas/atmosphere monitoring; and refresher training modules). Key highlights included

- the completion of an independent, multi-institutional External Safety Review confirming the Lab's core programs meet or exceed OSHA and NSF expectations and identifying opportunities for cross-site standardization and improved contractor/visitor oversight (with actions implemented for all recommendations),
- expanded AI-enabled safety tools—supported by the Moneta near-miss app (beta, planned for lab-wide deployment)—to improve early hazard detection and enable phone-based, photo, and anonymous reporting with automated status notifications.

User safety remained strong through required pre-arrival and on-site training and support, with 98% of external users being satisfied or very satisfied with overall safety. The Psychological Safety Training Program (launched in 2024) continued to strengthen communication, trust, and speaking up to support hazard reporting and a culture where all voices are valued.

LOOKING AHEAD

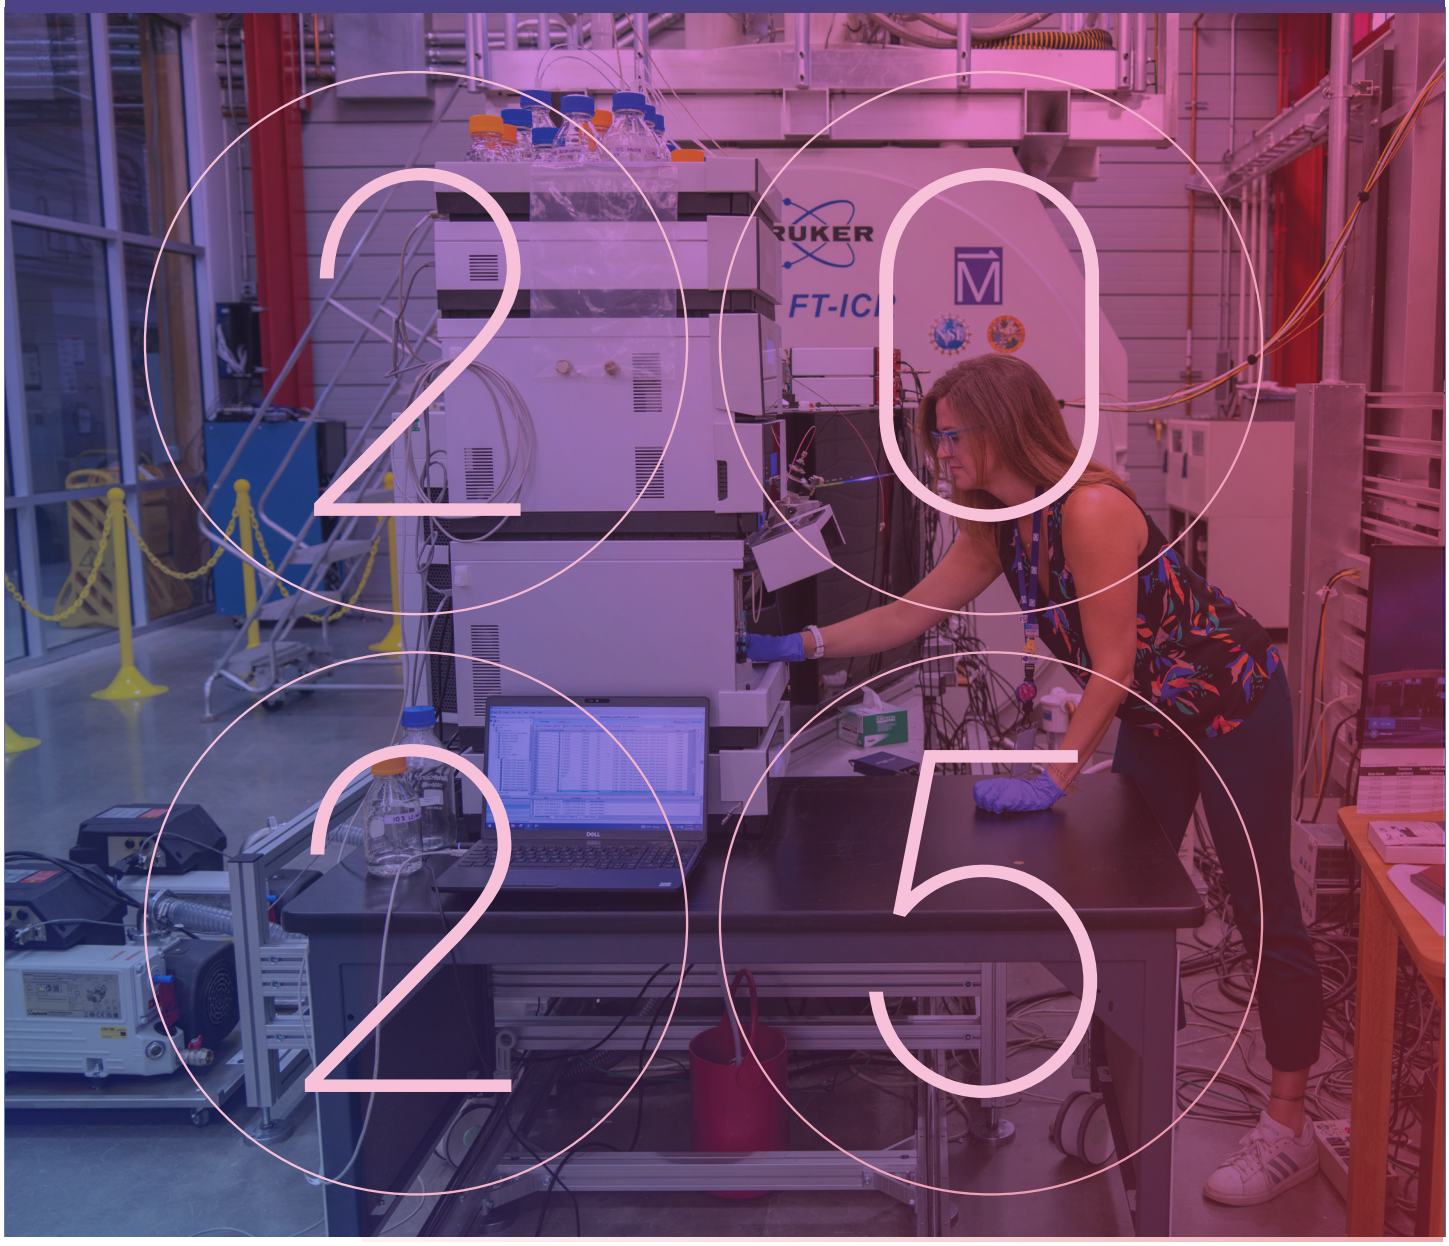
New instrumentation and training are planned for 2026 that seek to expand the lab's scientific and technological capabilities:

- DC Field Facility finalized project plans for several critical infrastructure initiatives that will be executed in the coming years. These plans include the replacement of the Cooling Towers (scheduled for 2026) in support of the water-cooled magnet operations, the replacement of the on-site electrical substation (2026/2027) to enhance electrical reliability for high-power magnet operations, and the installation of power quality conditioning equipment (2026/2027). Plans were developed for the refurbishment of the 3-million-gallon chilled water storage tank (2026).
- With the two new magnets now installed and operating well in EMR, we will now have new capabilities and improve overall operational reliability on two workhorse spectrometers (HiPER and Broadband Homodyne Transmission). This will allow us to allocate more time for external users in comparison to 2025, when the downtime, installation, and testing took a non-negligible part of the instrument time. The enhancements with the 10W cw amplifier will allow for longer pulse sequences and higher resolution of selected applications, while the optical switch will allow the study of fast-relaxing systems.
- Bruker X-/Q-band (9/34GHz) pulsed EPR spectrometer will be available to users in 2026, allowing pulsed EPR/ENDOR at Q-band, arbitrary pulse shaping with the AWG, and the possibility of optical excitation enabled by an accompanying OPO-laser.
- Support from the QSE initiative to develop a tunable (2-18GHz) pulsed EPR spectrometer based on a qubit controller purchased from the company QBlox Quantum. Work has been ongoing in 2025, and the first experiments in the magnet are planned for spring 2026.
- A very wideband pulsed instrument is currently under development that leverages a single qubit controller acquired from the company QBlox Quantum (Delft, Netherlands). These devices are manufactured for use with real quantum computing devices, enabling programmable operation of quantum processors in the DC to 18.5GHz range. This development responds to a national need identified in a recent National Academies report (https://doi.org/10.17226/26850) – that of a widely tunable pulsed EPR spectrometer to characterize new quantum systems that operate optimally at frequencies not reachable with commercial spectrometers. We plan to integrate this new capability with an existing split-pair 7T superconducting magnet system. A future frequency-doubling capability will further extend the wideband coverage of this instrument.
- Return of uninterruptible and clean power infrastructure for High B/T planned for 2026, so routine electron temperatures below 10mK can be provided in the quantum materials being studied by users.

- The ICR facility will continue to expand its user facility using the world's first 21T FT-ICR mass spectrometer, including expansion of the MALDI imaging sampling and acquisition capabilities, and LC FT-ICR MS for complex mixtures. A new MALDI imaging source, compatible with the front-end upgrades to the 14.5T and 21T instruments, has been acquired.
- The new ICR trapped ion mobility spectrometry (TIMS) capability allows rapid gas-phase separation of isomers for improved imaging and analysis of complex mixtures.
- Improved automation of dissolved organic matter direct infusion analysis, an approach that, along with automated AI-driven data analysis, will significantly increase sample throughput in our Facility.
- 1.9mm HXY low-temperature (100K) DNP MAS probe is in construction in the NMR Facility with an estimated delivery of fall 2026.
- The control software required to operate the 85T duplex system in combined mode is presently being tested with an anticipated commissioning of the system before the end of 2026.
- The rectification control system (the PSRs) - vital infrastructure for powering the 100T and 60T controlled waveform magnets – will be replaced in 2026.

NATIONAL MAGLAB

AT A GLANCE



Florida State University • University of Florida • Los Alamos National Laboratory

Supported by the National Science Foundation and the State of Florida

1

A NATIONAL RESOURCE

Seeking the most powerful magnetic fields on Earth, scientists and engineers from around the world conduct their experiments at the National MagLab. In 2025, our **1,637** users represented **302** universities, government labs and private companies worldwide.

81% UNIVERSITIES **15%** GOVERNMENT LABS **4%** INDUSTRY

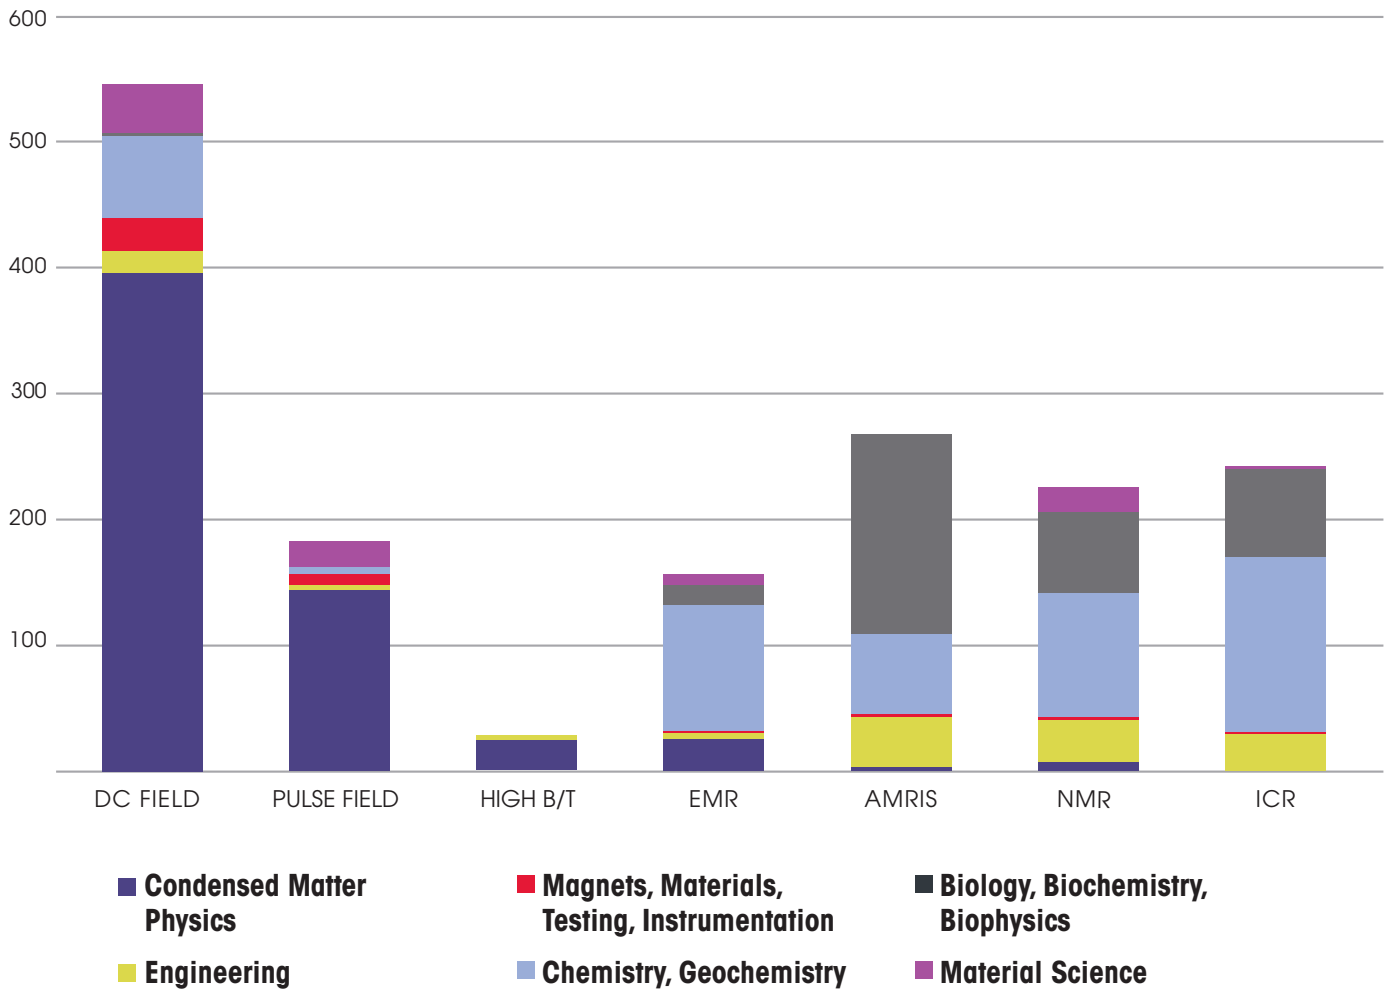
WHO OUR USERS ARE

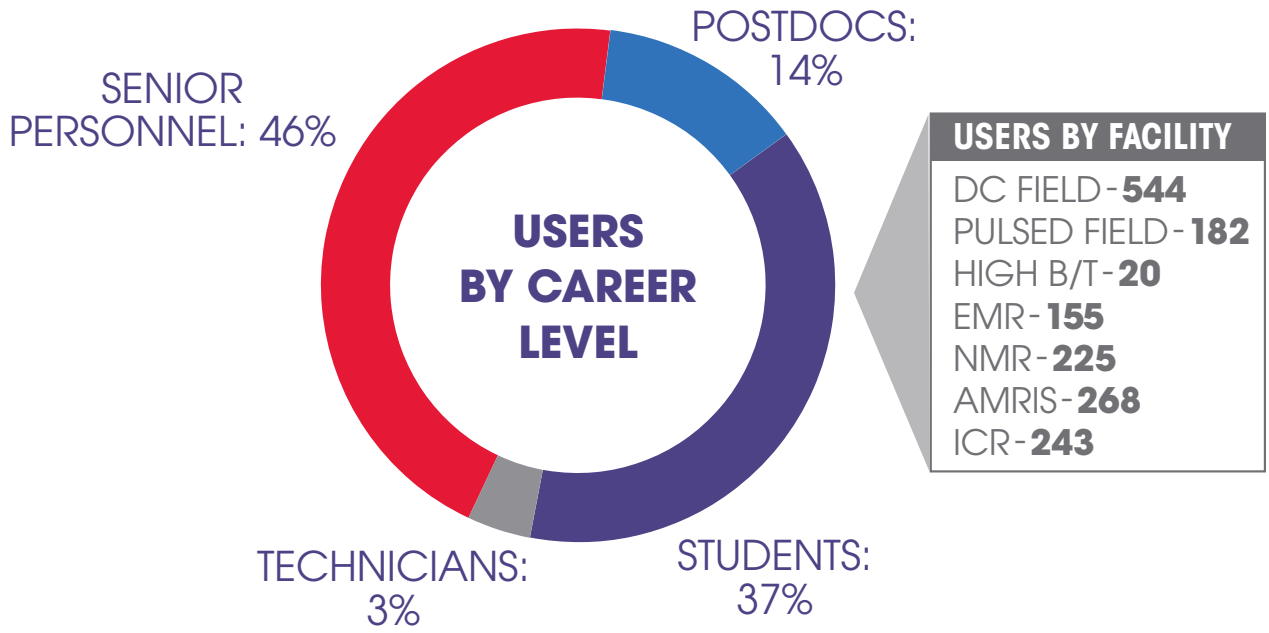
High magnetic fields are a powerful research tool across many disciplines leading to groundbreaking discoveries that impact your life. The lab comprises 7 distinct user facilities that offer our researchers a wide range of research capabilities:

- **DC Field**
  Steady, continuous magnetic fields up to 45 T
- **Pulsed Field**
  Short, ultra-powerful magnetic fields up to 100 T
- **High B/T**
  Magnetic fields up to 15 T combined with ultra-cold temperatures of 0.4 mK
- **Electron Magnetic Resonance (EMR)**
  Magnetic resonance techniques associated with the electron
- **Nuclear Magnetic Resonance (NMR)**
  Solid & solution state NMR & animal imaging
- **Advanced Magnetic Resonance Imaging & Spectroscopy (AMRIS)**
  High-resolution solution and solid-state, NMR, animal imaging & human imaging
- **Ion Cyclotron Resonance (ICR)**
  Ultra-high resolution and high mass accuracy Fourier transform ion cyclotron resonance (FT-ICR) mass spectrometry

2025 USERS BY DISCIPLINE



4



WHAT OUR USERS SAY

97% of users were satisfied with performance of the facilities and equipment.

96% of users were satisfied with the assistance provided by MagLab technical staff.

97% of users were satisfied with the proposal process.

98% of users were satisfied or with the overall safety at the MagLab.

Data reflects external users only.

MAGLAB STAFF

The MagLab employs a skilled workforce of scientists, machinists, engineers, and technichians.

Total MagLab Staff: **562**

- Senior Personnel: **187**
- Other Professional: **78**
- Support Staff - Technical: **71**
- Support Staff - Secretarial: **20**
- Postdoctoral: **43**
- Graduate Student: **97**

SPARKING CURIOSITY

Whether in a traditional classroom setting or on our website, within the walls of our lab or in universities around the globe, the National MagLab is committed to sharing our passion for science. We are growing the next generation of scientists and inspiring all individuals about the magic of discovery in high magnetic fields.

2,000+

K-12 students participated in Classroom Outreach or a field trip.

10,000+

visitors of all ages during our annual **5-hour** Open House event

4.4 MILLION

website interactions

100+

Students in long term mentorship or camp programs

870

news articles, blogs, or social media posts with an estimated reach of nearly people.

500+

Children and parents attended MagLab Science Night at the Libary.

7

1 LABORATORY MANAGEMENT

1.1 Organization

Florida State University (FSU), the University of Florida (UF), and Los Alamos National Laboratory (LANL) jointly operate the National High Magnetic Field Laboratory (NHMFL or MagLab) under a cooperative agreement with the National Science Foundation (NSF). This agreement outlines the MagLab's goals and objectives. As the signatory institution, FSU holds primary responsibility for the administrative and financial oversight of the MagLab, ensuring its operations align with the cooperative agreement. **Kathleen Amm is serving as Director of the MagLab.**

Leadership Updates. Personnel appointed to MagLab Leadership since 2024/2025 are: MagLab Director (Kathleen Amm), Deputy Lab Director (Tim Murphy), ICR User Facility Director (Kristina Håkansson), DC Field User Program & Instrumentation (Ali Bangura), DC Field Facilities & Magnet Operations (Julia Smith), Director of Magnet Science & Technology (Tom Painter), Business Administration (JJ Jacob), Human Resources (Kayla West), Employee Health and Safety (Alfie Brown).

PI and Co-PIs:

- Kathleen Amm (PI)
- Kristina (Kicki) Hakansson (Co-PI)
- Joanna Long (Co-PI)
- Ross McDonald (Co-PI)
- Eric Palm (Co-PI)

The **MagLab Leadership Team**, composed of senior scientists and administrators, meets monthly to address lab-wide and program-specific matters. Two external committees provide essential guidance:

- The **External Advisory Committee (EAC)**, comprising representatives from academia, government, and industry, advises on management and strategic direction.
- The **User Committee (UC)** supports the development and utilization of facilities and services for scientific research.

1.2 External Advisory Committee

The External Advisory Committee (EAC) is made up of representatives from academia, government, and industry. This committee offers advice on matters critical to the successful management of the lab.

Leadership

- **Chair**: Stuart Brown — University of California, Los Angeles
- **Vice Chairs**:
  - Luca Bottura — CERN
  - Songi Han — Northwestern University

Magnet Technology and Materials Subcommittee

- Luca Bottura — CERN
- Jeff Parrell — Bruker OST LLC

Biology and Chemistry Subcommittee

- R. David Britt — UC Davis
- Wei Chen — University of Minnesota
- Robert Griffin — MIT
- Songi Han — Northwestern University
- Yining Huang — Western University (Canada)
- Christopher Jaroniec — The Ohio State University
- Tatyana Polenova — University of Delaware
- Susan Richardson — University of South Carolina
- Vicki Wysocki — Georgia Institute of Technology

Condensed Matter Subcommittee

- Christoph Boehme — University of Utah
- Dan E. Dahlberg — University of Minnesota
- Rachel Goldman — University of Michigan

Ex Officio Member

- Franklin Leach — University of Georgia

1.3 USER COMMITTEE

The MagLab's User Committee serves as a representative body for its broad, multidisciplinary user community, providing guidance to Lab leadership on matters affecting users of MagLab facilities. Members of the User Committee are elected from the user base, with each facility having its own subcommittee chosen by its users to advocate for their interests.

Some facilities share representation: the DC Field and High B/T facilities have a joint subcommittee, as do the NMR facilities at the University of Florida and Florida State University. Separate subcommittees exist for the Pulsed Field, Ion Cyclotron Resonance (ICR), and Electron Magnetic Resonance (EMR) facilities. Each subcommittee elects representatives to serve on the User Executive Committee, which in turn elects a chair and two vice chairs.

From November 4–6, 2025, the DC Field/High B/T Advisory Committee, Pulsed Field Advisory Subcommittee, EMR Advisory Subcommittee, NMR/MRI Advisory Committee, and the ICR Advisory Committee representative convened in Tallahassee, FL to review the state of the MagLab and provide feedback to both NSF and MagLab management. The 2025 User Advisory Committee Report is now available on the User Committee – MagLab website.

Executive Committee

- Chair: Franklin Leach – University of Georgia
- Vice Chair: Michihiro Hirata – Los Alamos National Laboratory
- Vice Chair: Galia Debelouchina – University of California, San Diego
- Nat Fortune – Smith College
- Raivo Stern – National Institute of Chemical Physics & Biophysics, Estonia
- Selvan Demir – Michigan State University

DC/High B/T Advisory Sub-Committee

- Ryan Baumbach – University of California, Santa Cruz
- Corey Frank – New Mexico State University
- Nat Fortune – Smith College
- Paula Gallo – Universidad de Los Andes, Colombia
- Long Ju – MIT
- Johannes Pollanen – Michigan State University
- Daniel Rhodes – University of Wisconsin – Madison
- Raivo Stern – National Institute of Chemical Physics & Biophysics, Estonia
- Sergei Zvyagin – Dresden High Magnetic Field Laboratory

EMR Advisory Sub-Committee

- Alina Bienko – University of Wroclaw
- Selvan Demir – Michigan State University
- Effie Kisgeropoulos – National Renewable Energy Laboratory
- Muralee Murugesu – University of Ottawa
- Troy Stich – Wake Forest University
- Joshua Telser – Roosevelt University

ICR Advisory Sub-Committee

- Jesse Canterbury – Thermo Fisher Scientific
- Caroline DeHart – Frederick National Laboratory for Cancer Research
- Ryan Julian – University of California, Riverside
- Franklin Leach – University of Georgia
- Caitlin Tressler – Johns Hopkins University School of Medicine
- Robert Young – New Mexico State University

NMR/MRI Advisory Sub-Committee

- Vipin Agarwal – Tata Institute of Fundamental Research
- Claudia Avalos – New York University
- Galia Debelouchina – University of California, San Diego
- Shella Keilholz – Emory University / Georgia Tech
- Isabelle Marcotte – Université du Québec à Montréal
- Andre Obenaus – University of California, Riverside
- Frédéric A. Perras – Ames National Laboratory, Iowa State University
- Lothar R. Schad – Medical Faculty Mannheim, University of Heidelberg

- Jun Xu – Innovation Academy for Precision Measurement Science and Technology, CAS

Pulsed Field Facility (PFF) Advisory Sub-Committee

- Charles (Chuck) Agosta – Clark University
- Joseph G. Checkelsky – Massachusetts Institute of Technology
- Krzysztof Gofryk – Idaho National Laboratory
- Michihiro Hirata – Los Alamos National Laboratory
- Rongyin Jin – University of South Carolina
- Sheng Ran – Washington University in St. Louis

1.4 PERSONNEL

As of January 23, 2026, the MagLab employs **562** individuals across its three sites. These personnel are funded by the NSF core grant, the State of Florida, and individual investigator awards, as well as a variety of home institutions and other sources. A list of MagLab personnel by department is presented in **Appendix I**.

Principal Investigators

- Kathleen Amm (PI)—Director/Professor
- Kristina (Kicki) Hakansson (Co-PI)—Program Director, ICR, FSU
- Joanna Long (Co-PI)—Program Director, AMRIS, UF
- Ross McDonald (Co-PI)—Program Director, PFF, LANL
- Eric Palm (Co-PI)—Deputy Lab Director

User Facility Directors

- Advanced Magnetic Resonance Imaging and Spectroscopy Facility (UF)—Joanna Long
- DC Field Facility (FSU)—Ali Bangura, Julia Smith
- Electron Magnetic Resonance Facility (FSU)—Stephen Hill
- High B/T Facility (UF)—Mark Meisel
- Ion Cyclotron Resonance Facility (FSU)—Kristina (Kicki) Hakansson
- Nuclear Magnetic Resonance (FSU)—Robert Schurko
- Pulsed Field Facility (LANL)—Ross McDonald

Of our 560 employees, senior personnel constitute the largest share at 33%, followed by graduate students (17%), other professionals (14%), technical staff (13%), undergraduate students (12%), postdocs (8%), and administrative staff (3%). See **Figure 1.4.1** for the full breakdown.

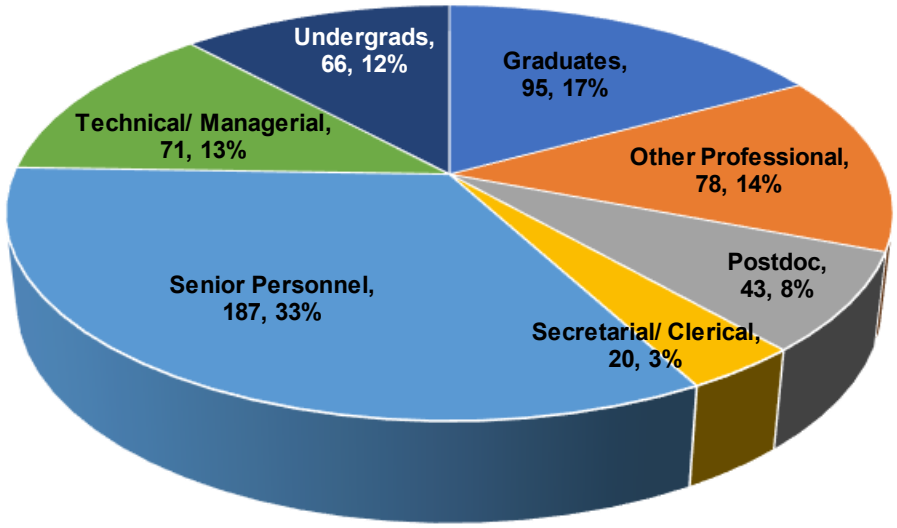

Figure 1.4.1. *MagLab Position Distribution (as of January 23, 2026).*

1.5 SAFETY

Safety is a foundational, non-negotiable value at the National High Magnetic Field Laboratory (MagLab). As a multi-institutional NSF user facility operating across Florida State University (FSU), the University of Florida (UF), and Los Alamos National Laboratory (LANL), the MagLab is responsible for maintaining a safe and educational environment for staff, users, contractors, and visitors. This responsibility spans a broad range of research environments—including high magnetic field laboratories, cryogenic systems, biosafety spaces, radiation-regulated areas, and specialized engineering shops.

The MagLab's Integrated Safety Management (ISM) Program forms the backbone of its safety culture. ISM embeds hazard identification, mitigation, and operational controls into every step of work planning and execution. Safety is treated as an investment in people and scientific productivity—not an expense—reinforced through leadership engagement, frequent communication, and a strong expectation of personal accountability. The MagLab is committed to nurturing a strong and sustainable safety culture. Some of the key practices that support this commitment include:

- Safety is considered a core value and an investment, not an expense.
- Management plays an active role in promoting and driving our Safety Culture.
- The MagLab Director hosts Quarterly Safety Meetings to address lab-wide safety issues and initiatives.
- The MagLab Director and Safety Director regularly conduct walk-throughs of lab areas to engage with researchers, staff, and users while observing ongoing work.
- All new employees receive safety training, including a new Employee ISM Training that focuses on the Lab's ISM process. Training encourages a strong safety mindset, fostering an interest in safety and familiarizing employees with the Lab's core values. Employees are further introduced to policies on Stop Work, near-miss/no-fault self-reporting, and accident reporting.

Leadership Engagement and Safety Culture

MagLab leadership actively promotes a robust and sustainable safety culture. Key leadership practices include:

- Quarterly Lab-Wide Safety Meetings, hosted by the MagLab Director since 2013, to highlight lessons learned, discuss near misses, and reinforce consistent safety messaging across all facilities and staff levels.
- Routine Safety Walkthroughs conducted by the Director and Safety Director in research, laboratory, and shop areas to engage with staff and observe work in progress.
- Expectations of Safety Ownership, empowering every employee, user, and visiting scientist with Stop Work Authority without fear of reprisal.
- Face-to-Face Safety Training for New Employees, including direct discussion with the Director or Deputy Director about ISM principles, the history of MagLab safety, near-miss reporting, and the importance of a no-fault reporting culture.

Across all sites, staff consistently report confidence in the MagLab's safety programs and appreciation for transparent communication, practical guidance, and ongoing opportunities for safety engagement.

Safety Investment and Resources

In 2025, the MagLab invested more than $70,000 in safety equipment, infrastructure improvements, training, and hazard monitoring devices. These investments support:

- Personal protective equipment (PPE)
- Lockout/Tagout and Controlled Energy verification
- Security system upgrades
- Gas and atmosphere monitoring tools
- Training modules and refresher programs

The Safety Department also collaborates closely with FSU EH&S, UF EH&S, and LANL Environment, Safety, Health, and Quality teams to ensure consistent, compliant, and proactive safety practices across all locations. Joint inspections, cross site trainings, and shared committee representation strengthen the cohesion and standardization of safety expectations.

Committees and Safety Governance
Safety oversight is supported by a suite of committees that meet regularly to analyze hazards, review incidents, and improve safety programs. These include:

- Director's Monthly Safety Committee (with UF and LANL participation)
- Safety Concerns Committee
- Lock/Tag/Verify Committee
- Cryogen Safety Committee
- Laser Safety Committee
- Electrical Safety Committee

Committee structures support the MagLab's ISM framework and allow targeted subcommittees to be convened when specific technical or safety concerns arise.

Reporting Systems and Data-Driven Prevention
The MagLab employs multiple tools to expand safety communication and near-miss reporting:

- SafeMag Reporting Portal – The SafeMag reporting portal remains the MagLab's established, lab-wide platform for confidential and anonymous reporting. It provides a consistent channel for staff and users to raise safety concerns, near misses, or improvement suggestions, and continues to support open communication while newer tools—such as the Moneta beta app—are evaluated for broader future deployment.
- Moneta Near-Miss Reporting App – This initiative is currently in its beta phase and is planned for future deployment lab-wide. The app enables proactive hazard identification, enhances safety culture, reduces workplace injuries, and promotes data-driven decision-making. Users can report near misses directly from their phones—with optional photos and anonymous submission—and receive notifications when reports are reviewed, commented on, or resolved.

These platforms support early detection of hazards, enhance psychological safety around reporting, and help the lab address concerns before they escalate.

User Facility Safety
The MagLab's User Facilities—including the DC Field, Pulsed Field, High B/T, NMR, AMRIS, EMR, and ICR platforms—support a diverse community of internal and external researchers. Ensuring user safety is a core priority, and the Lab applies a structured, multilayered approach that begins well before a user arrives on site.

To prepare for their visit, users are assigned a combination of online and in-person training modules tailored to the specific facility in which they will work, and the hazards associated with their planned experiments. For external users, this coordination begins several weeks in advance to ensure all required modules are completed before authorization. Users must finish all mandatory training before they are permitted to begin work.

Upon arrival, users receive hands-on, site-specific instruction and are encouraged to discuss any technical or safety concerns with user support personnel. Throughout their time at MagLab facilities, users are paired with in-house scientists or technicians who provide continuous technical guidance and reinforce safe operational practices. This partnership model is especially important in high-hazard or highly specialized environments, where only trained and experienced facility personnel are permitted to carry out non-routine or particularly hazardous tasks.

This structured preparation—advanced training, on-site instruction, and ongoing professional support—ensures that users are equipped to work safely, confidently, and productively within the MagLab's complex, high-field research environment.

Safety Highlights
The MagLab continues to advance its safety culture through proactive initiatives, technology adoption, and strengthened cross-site coordination.

One major area of progress is the expansion of Artificial Intelligence (AI)–enabled safety tools. The Safety Department is piloting the use of AI to identify leading indicators of potential incidents, enabling earlier intervention and more predictive hazard mitigation. This effort is supported by the Moneta near-miss reporting app, which is currently in its beta phase and planned for future lab-wide deployment. Moneta allows individuals to submit near misses directly from their phones—optionally including photos and anonymous submissions—and provides automatic notifications when reports are reviewed, commented on, or resolved. This functionality enhances transparency, strengthens engagement, and supports data-driven safety decision-making.

In 2025, the Safety Department completed the External Safety Review, a comprehensive evaluation conducted by an independent, multi-institutional committee. The review affirmed that MagLab's core safety programs meet or exceed OSHA and NSF expectations, highlighted the Lab's strong safety culture, and identified opportunities for cross-site standardization and enhanced contractor and visitor oversight. The

MagLab responded to each recommendation with documented action items, many of which are already implemented.
The MagLab also launched its Psychological Safety Training Program in 2024, reinforcing the critical connection between communication, trust, and hazard reporting. This program provides strategies for respectful dialogue, constructive feedback, and speaking up about concerns without fear of reprisal—further strengthening the Lab's safety climate and supporting a culture where all voices are valued.
Additionally, the MagLab completed CPR and First Aid training across multiple departments, increasing onsite emergency preparedness and improving first response capability within laboratory environments.
Collectively, these initiatives demonstrate the Lab's ongoing commitment to continuous improvement, transparent communication, and the protection of its most important resource—its people.

Ongoing Commitment and Continuous Improvement
MagLab leadership, in collaboration with institutional partners, remains committed to strengthening safety performance, empowering staff, and proactively identifying hazards before they pose risks. Through:

- Continued investment in safety tools and infrastructure
- Expanding reporting systems
- Regular training and inspection cycles
- Active leadership involvement
- Integration of lessons learned
- Transparent communication

the MagLab ensures a safe, supportive, and productive research environment for the diverse community it serves.

Above all, MagLab recognizes that while the laboratory houses world class instrumentation and infrastructure, its greatest asset is its people. Protecting them remains its highest priority.

1.6 BUDGET

The National High Magnetic Field Laboratory is primarily funded by the National Science Foundation. Other operating funds are provided through the participating institutions: Florida State University, University of Florida, and Los Alamos National Laboratory. Additionally, faculty and staff have been very successful in securing individual research funding for specific areas of research from a wide variety of sources, including federal, state, and private sectors.

The National Science Foundation Division/Directorate approved the National High Magnetic Field Laboratory's facilities award for 2023-2027 on December 12, 2022. For the Calendar Year 2025, NSF provided an operating budget of $38,566,495.

Table 1.6.1 represents the budget allocation and percentage of the total budget to each department/division of the National High Magnetic Field Laboratory. **Table 1.6.2** summarizes the MagLab's budget position as of December 31, 2025.

Table 1.6.1. *NSF Budget by MagLab Departments/Divisions*

Division/Program	CY 2025 Total Funding ($)	Budget (%)
Operations/Safety	2,058,481	5.34%
DC Field Facility/Facilities	8,976,668	23.28%
Magnet Science & Technology	5,769,886	14.96%
NMR	1,247,072	3.23%
ICR	2,100,000	5.45%
EMR	939,187	2.44%
CIRL and REU	432,161	1.12%
ASC	2,001,759	5.19%
Electricity & Gases	4,193,801	10.87%
LANL	9,100,000	23.6%
UF High B/T	456,403	1.18%
UF - AMRIS	759,218	1.97%
User Collaboration Grants Program	253,794	.66%
FAIR Data	278,065	.72%
Supplemental Awards	-	-
Total Operations	**38,566,495**	**100.0%**

Table 1.6.2. *NSF Budget & Expenses – Calendar Year 2025*

Expense Classification	Budget ($)	Expenses and Encumbered ($)	Balance ($)
Salaries and Fringe	**12,299,386**	9,387,623.97	2,911,762.03
Equipment	**43,722**	414,779.22	(371,057.22)
Travel	**187,575**	211,931.56	(24,356.56)
Participant Support	**125,902**	198,476	(72,574)
Direct Expense	**3,007,760**	3,756,516.11	(748,756.11)
Subawards	10,603,489	10,603,489	-
Other Direct Costs	**3,291,311**	2,378,366.26	912,944.74
Subtotal	29,559,145	26,951,182.12	(99,037.12))
Indirect Cost	**9,007,350**	8,787,624.07	219,725.93
Total Direct and Indirect Cost	**38,566,495**	**35,738,806.19**	**2,827,688.81**

Notes:
Per the Cooperative Agreement, DMR 2128556, the CY 2025 funded budget is $38,566,495.
Negative values are attributed to the following:

- Equipment encumbrances include purchases that have a lengthy lead time from the time the order is placed until receipt of the goods.
- Travel is not encumbered within the University system and credit card purchases are not included in unliquidated obligations.
- Participant Support housing costs are paid on a delay, after all rooms used have been inspected to ensure no damage and capture final costs.
- Indirect costs are not encumbered and not charged until expenses have posted.

1.7 MAGLAB COST RECOVERY REPORT

Seldom does the NHMFL incur costs due to resources used for companies doing proprietary research. On occasion, companies will need access to the unique equipment at the NHMFL, and they will contract for the use of said equipment. The NHMFL has established procedures to accumulate and report costs continuously and consistently for all such contracts based upon an agreed schedule of fees and costs to cover the use of such equipment that involves proprietary research.

In 2025, the MagLab received no income for the use of NSF-funded equipment during the period of performance of our federal award.

1.8 INDUSTRIAL PARTNERSHIPS AND COLLABORATION

The MagLab collaborated with dozens of companies, national/international labs, universities, and community groups in 2025.

INDUSTRY

Advanced Conductor Technologies, Boulder, CO: The Applied Superconductivity Center and the Magnet Science and Technology Division of the MagLab are collaborating with Advanced Conductor Technologies on the development and testing of Conductor on round Core (CORC®) cables, using multi-layer spiraling tapes around a core, for magnet applications. The ongoing collaboration on measurements of HTS cables at large diameter and high magnetic fields (10 KA in 160 mm at 12 T at ASC) continues to set new benchmarks for peak current, current density, bend radius, and ramp rates. DOE Office of Fusion Energy has now supported manufacture and test of 3 such coils. (*MagLab contact: Ulf Trociewitz, ASC*)

Advanced Superconducting Materials, Lexington, KY: This collaboration has focused first on the development of a photo-acoustic measurement device. The second focus was on the development of reel-to-reel critical current measurement device that works at high fields and temperatures down to 4 K. (*MagLab contact: Daniel Davis, ASC*)

ATI Specialty Metals and Products, Albany, OR: This collaboration with ATI metals is in the development of new Nb alloys for Nb3Sn superconducting wire fabrication. The new alloys exhibit improved properties at high fields and could be used for accelerator magnets in facilities like the Future Circular Collider (FCC) under consideration by CERN. (*MagLab contact: David C. Larbalestier & Shreyas Balachandran, ASC*)

Black Fox LLC, Tallahassee, FL: Black Fox LLC is a MagLab spinoff company that builds custom magnetic resonance probes for research institutions. (*MagLab contact: Peter Gor'kov, NMR*)

Bruker Biospin, Billerica, MA: This is a collaborative work on MAS-DNP probe development. (*MagLab contact: Frederic Mentink-Vigier, NMR*)

Bruker, Bremen, Germany: Bruker is the only commercial vendor of FT-ICR MS. We have procured a prototype of their coming product coupling trapped ion mobility (TIMS) with ICR. This prototype will be further developed through a research agreement between Bruker and the MagLab. (*MagLab contact: Kristina Hakansson, ICR*)

Bruker Corporation, Billerica, MA: Investigators from MagLab facilities at UF and FSU collaborate with technical staff at Bruker on NIH-funded projects to develop improved superconductive cryogenic probes for solution NMR. (*MagLab contact: William Brey, NMR*)

Bruker-OST, Carteret, NJ: Extensive collaborations exist between ASC and BOST on both Nb3Sn and Bi-2212 conductor development, aided by direct support of R&D on these materials from DOE-High Energy Physics to ASC PIs, DOE-Accelerator R&D and Production to Lawrence Berkeley National Laboratory (LBNL) and ASC PIs, and to BOST through the Conductor Development Program (now called Conductor Procurement and R&D Program) managed by ASC in partnership with LBNL. Through these collaborations, BOST has been able to develop the most advanced Nb3Sn and Bi-2212 conductors produced. (*MagLab contact: David C. Larbalestier, ASC*)

Commonwealth Fusion Systems, Deven, MA: Fatigue tests of steel welds at liquid nitrogen temperature under high loads up to 200 kN. (*MagLab contact: Jun Lu, MST*)

Commonwealth Fusion Systems, Deven, MA: This collaboration involves the characterization of REBCO superconducting tapes. CFS is an American fusion power company founded in 2018 in Cambridge, Massachusetts after a spin-out from the Massachusetts Institute of Technology (MIT). Its stated goal is to build a small fusion power plant based on the tokamak design. (*MagLab contact: Jan Jaroszynski, DC*)

Cryogenic, Ltd, London, UK: The MagLab is collaborating with the Cornell High Energy Synchrotron Source to design an advanced x-ray scattering beamline capable of operating under high magnetic fields. To achieve this, CHESS has commissioned Cryogenic, Ltd to construct a 20 T superconducting magnet featuring a conical bore. Experts at the MagLab have offered guidance to Cryogenic, Ltd regarding the quench dynamics associated with this type of system. (*MagLab contact: Mark Bird, DIR*)

Cryomagnetics Inc, Oak Ridge, TN: Cryomagnetics partners with MagLab on superconducting high-field hybrid magnets utilizing Bi-2212 HTS coils through a Department of Energy Phase-IIa Small Business Technology Transfer award. The company also holds a license for Bi2Sr2CaCu2O8−x superconductor technology developed by MagLab. Their collaboration centers on designing, building, and heat-treating Bi-2212 coils for integration into Cryomagnetics' LTS magnet systems. (*MagLab contact: Ulf Trociewitz, ASC*)

Cryomagnetics Inc., Oak Ridge, TN: The collaboration is to develop high field superconducting magnets of 30T class using REBCO technology with bonded insulation. (*MagLab contact: Hongyu Bai, MST*)

D-Wave, West Palm Beach, FL: Quantum analog simulators are being rapidly developed and reaching the point where we can use them to simulate and understand quantum magnets. Here we collaborate with D-wave computing as part of a LANL DR project to use their hardware to simulate quantum magnets. (*MagLab contact: Vivien Zapf, PFF*)

Danfoss Turbocor Inc, Tallahassee, FL: Danfoss Turbocor Inc. is a company specializing in oil-free compressors. The compressors are specifically designed for the heating, ventilation, air conditioning, and refrigeration (HVACR) industry and need high-performance soft and hard magnet materials. The company and the laboratory have a joint research project on the selection, characterization, and development of permanent magnet materials and structural materials for high-performance and environmentally friendly compressors. (*MagLab contact: Ke Han, MST*)

ECMC Foundation, Los Angeles, CA: The ECMC Foundation represents an unyielding commitment to opportunity and student-centered strategies to eliminate gaps in postsecondary completion. ECMC has awarded the MagLab 2 mini grants over the last few years to support our efforts in building the skilled technical workforce. (*MagLab contact: Kawana Johnson, CIRL*)

Engi-Mat Co, Lexington, KY: Engi-Mat is a small business specializing in manufacturing advanced nanomaterials. MagLab collaborates with Engi-Mat Co on a small business innovation research grant funded by the US Department of Energy and a DOE-Accelerator R&D and Production grant to Lawrence Berkeley National Laboratory (LBNL) and ASC PIs. The goal of this research is to improve the quality and reproducibility of Bi2Sr2CaCu2O8−x powder for superconducting wires. (*MagLab contact: Jianyi Jiang, ASC*)

GE Healthcare, Florence, South Carolina: Measurement of thermal expansion of epoxy samples at cryogenic temperatures. (*MagLab contact: Jun Lu, MST*)

Helion Energy, Everett, WA: Develop high strength greater than 750 MPa and conductivity greater than 80% IACS for normal conducting magnets for magneto-inertial fusion (*MagLab contact: Shreyas Balachandran, ASC*)

High Temperature Superconductor Inc, Santa Barbara, CA: HTSI, now 6 years old, is developing production systems for making REBCO coated conductors by pulsed laser deposition. Under ARPA-E support, Applied Superconductivity Center is working with them on the superconducting and nano structural characterization of their superconducting tape. (*MagLab contact: Fumitake Kametani, ASC*)

Honeywell International Inc., Las Vegas, NV: Working on improving the efficiency of the motors. (*MagLab contact: Ke Han, MST*)

Koch Modular Systems, Paramus, NJ: Koch is collaborating with development of a pilot-scale solvent extraction system for barium and radium extraction from our Process 2, currently in prototype scale. This collaboration would focus on rare earth element extraction using their Scheibel™ column technology. (*MagLab contact: Munir Humayun, RECMIB*)

Materion, Newton, MA: This collaboration involves the development of new Nb alloys for the Nb3Sn superconducting wire fabrication to be used for accelerator magnets like the Future Circular Collider (FCC) to be built at CERN. *(MagLab contact: David C. Larbalestier, ASC*)

Mevion Medical Systems, Littleton, MA: As part of quality assurance, Mevion Medical Systems works with the MagLab to conduct critical current (IC) testing on their superconducting cables, which are used to construct proton therapy magnets. The results from these tests enable them to develop magnets that ramp up more efficiently and with improved performance. (*MagLab contact: Todd Adkins, MST*)

MicroHarmonics.com, Fincastle, VA: Devices are tested until they fail permanently, after which they are sent back for analysis and enhancement. This collaboration benefits both parties by refining products for the MagLab as well as the broader community. (*MagLab contact: Thierry Dubroca, NMR*)

Moneta Tech., Lubbock, TX: The MagLab is beta testing Moneta as a proactive safety initiative involving the use of predictive AI to evaluate key performance indicators and catch near misses proactively so they do not turn into incidents. These reports can be submitted via website or app and can be submitted with the option of anonymity. (*MagLab contact: Alfie Brown, DIR*)

Mosaic Company, Tampa, FL: Our Joint Development Agreement aims to establish a domestic supply of rare earth elements by utilizing the phosphoric acid process stream and waste products, specifically phosphogypsum. The project also focuses on removing radionuclides from these waste materials. We are developing a solution that addresses both a national security concern—critical element supply chains—and the persistent waste storage issues affecting the industry and the State of Florida, which is ultimately responsible for managing legacy storage sites. (*MagLab contact: Munir Humayun, RECMIB*)

Nikon, Melville, NY: The MagLab maintains close ties with Nikon on the development of an educational and technical support microscopy website, including the latest innovations in digital-imaging technology. As part of the collaboration, the MagLab is field-testing new Nikon equipment. (*MagLab contact: Eric Clark, DIR*)

Nutrien, White Springs, FL: The MagLab work to create a domestic rare earth element and yttrium supply chain from their process stream, and waste streams (phosphogypsum, phosphatic clays). They are interested in the development of methods for enhanced phosphate recovery from clay wastes to extend the life of the White Springs operation. (*MagLab contact: Munir Humayun, RECMIB*)

Oxford Instruments – Quantum Design, Oxford, UK: This collaboration with OINS on the development of high-field insert magnets made with Bi-2212 wire for use in 30+T NMR as well as 25T class compact research magnet systems. Particularly for NMR magnets, Bi-2212 conductor promises several significant advantages that will be exploited here. (*MagLab contact: David Larbalestier, ASC*)

Pasqal computing, Paris, France: This work uses Pasqal's cold atom quantum computing hardware to simulate quantum magnets, as well as to use real experimental data to benchmark the quantum hardware. (*MagLab contact: Minseong Lee, PFF*)

Phoenix NMR, LLC, Loveland, CO: MagLab's NMR instrumentation program and Phoenix NMR collaborate on the development of stators for magic angle spinning NMR. Phoenix NMR also used the NMR Dynamic Nuclear Resonance facility to test a commercial DNP probe. (*MagLab contact: Peter Gor'kov, NMR*)

Rolls-Royce, London, UK: Rolls-Royce is interested in physical properties of several metallic alloys at cryogenic temperatures from 4.2 K to room temperature. (*MagLab contact: Jun Lu, MST*)

Scientific Instruments, West Palm Beach, FL: Investigating the impact of high magnetic fields on the electrical and magnetic properties of ZrON (zirconium oxynitride) thin film sensors to enhance their performance in extreme environments. ZrON thin films are known for their stability and sensitivity over wide temperature ranges, making them suitable for applications in cryogenic sensors and magnetic field detectors. Understanding their behavior under high magnetic fields is crucial for optimizing their functionality in advanced technological applications. (*MagLab contact: Kaya Wei, DC*)

Solid Power, Louisville, CO: This collaboration develops new materials for all-solid-state batteries, leveraging insights gained from magnetic resonance characterizations. (*MagLab contact: Yanyan Hu, NMR*)

SuperPower Inc., East Glenville, NY: Characterizations of REBCO conductors are needed to debug, optimize, and verify conductor quality made using new production lines to meet fusion and high-field magnet specifications (part of DOE INFUSE program). (*MagLab contact: Dmytro Abraimov, ASC*)

SuperPower Inc, Schenectady, NY: The MagLab is collaborating with SuperPower Inc. on the characterization of YBCO-coated conductors. This material has the potential to transform the field of high-field superconducting magnet technology and is in an early stage of commercialization. The MagLab will work to improve our understanding of this product and provide guidance to SuperPower on enhancing the quality of its products. (*MagLab contacts: Tom Painter, MST; David C. Larbalestier, ASC*)

Thermo Fisher Scientific, San Jose, CA: Over several years, we have worked together to enhance our ICR instruments by integrating advanced front-end technology and smoothly incorporating the Maglab ICR component into the systems for instrument control and data acquisition. (*MagLab contact: Chad Weisbrod, ICR*)

TotalEnergies, Tallahassee FL: This partnership is centered around expanding and extending analytical methods as well as developing instrumentation for the characterization of real-world, extremely complex, mixtures. (*MagLab contact: Ryan Rodgers, ICR*)

Travertine Technologies Inc., Boulder, CO: Travertine, in partnership with Mosaic Company, is developing uses for phosphogypsum in cement production, addressing radium removal and rare earth extraction to prepare gypsum for their process. (*MagLab contact: Munir Humayun, RECMIB*)

Type One Energy, Knoxville, TN: Consultation for the development of new types of REBCO cables for fusion devices. Also testing of cables to verify performance. Cables are essential to large magnets, including fusion devices and user magnets like the 45 T hybrid (part of the DOE INFUSE program). (*MagLab contact: Tom Painter, MST*)

NATIONAL OR INTERNATIONAL LABORATORIES AND INSTITUTES

Brookhaven National Laboratory, Long Island, NY: Testing superconducting properties of NbTi strands in support of Electron Ion Collider project at the Brookhaven National Laboratory. (*MagLab contact: Jun Lu, MST*)

CEA Grenoble, Grenoble, France: Development of polarizing agents for the MAS-DNP instrument. (*MagLab contact: Frederic Mentink-Vigier, NMR*)

CERN, Geneva, Switzerland: Collaboration to revisit Cu-Sn mixing and its impact on critical wire properties for both RRP wires and those made in house at the ASC with various dopants and heat treatments. These studies offer a path to higher Jc Nb3Sn for applications in accelerator technology, solenoid magnets, and some fusion devices. (*MagLab contact: Chris Segal, ASC*)

CERN, Geneva, Switzerland: RRP Nb3Sn mechanical characterization for applications for dipole magnets for LHC. (*MagLab contact: Najib Cheggour, ASC*)

CNR-SPIN, Genova, Italy: This work involves the publication of guidelines to correctly perform scientific analysis of experimental data relevant for superconductivity. This effort generates useful tutorial(s) to prevent scientific errors that had previously caused paper withdrawal due to macroscopic miscalculation. (*MagLab contact: Chiara Tarantini, ASC*)

Cornell High Energy Synchrotron Source, Ithaca, NY: The work focuses on the implementation of a FAIR data management solution developed by CHESS called FOXDEN. It is important for the MagLab's goal of ensuring all research data is FAIR and AI-ready. (*MagLab contact: David Butcher, ICR*)

Fermi National Accelerator Laboratory, Batavia, IL: Measurement of critical current in Nb3Sn for AUP project which is a collaboration between FANL and CERN on high luminosity upgrade of LHC. (*MagLab contact: Jun Lu, MST*)

Fermi National Accelerator Laboratory, Batavia, IL: MagLab and Fermilab have mutual interests in developing conductor and magnet technologies. One such mutual interest is a proposed muon collider. Another such mutual interest is a national network of magnet testing facilities. (*MagLab contact: Lance Cooley, DIR*)

Fermi National Accelerator Laboratory, Batavia, IL: Management of conductor procurement for the US High-Luminosity LHC Accelerator Upgrade Project. (*MagLab contact: Lance Cooley, DIR*)

French Alternative Energies and Atomic Energy Commission (CEA), Saclay, France: Working to exchange students and develop a better understanding of Cu-Sn mixing and effects on critical properties of Nb3Sn for high-field applications in accelerator and fusion sciences. (*MagLab contact: Chris Segal, ASC*)

HL-LHC Accelerator Upgrade Project, Geneva, Switzerland: The AUP is the US contribution to the High-Luminosity Upgrade of the Large Hadron Collider. MagLab oversees a $25 million component to procure 10 tons (7 tons have been delivered as of Feb 2021) of the highest-performing Nb3Sn conductor ever made and verify its quality by testing critical current and other properties. (*MagLab contact: David C. Larbalestier, ASC*)

International Muon Collider Collaboration, Geneva, Switzerland: MagLab has common and synergistic interests in the development of high-field HTS magnets that would be needed in an international project to design, develop, and build a muon collider at a European site. (*MagLab contact: Lance Cooley, DIR*)

Japan Proton Accelerator Research Complex (J-PARC), Japan: This collaboration performs neutron-diffraction experiments on RRP® Nb3Sn wires to find the origin of the strain irreversibility cliff in these conductors and to identify the different phases present in the conductor after heat-treatments. Work from this collaboration will expand to also include other conductors currently being developed such as Nb3Sn containing additional pinning centers. (*MagLab contact: Najib Cheggour, ASC*)

Karlsruhe Institute of Technology, Eggenstein-Leopoldshafen, Germany: This work involves the publication of guidelines to correctly perform scientific analysis of experimental data relevant for superconductivity. This effort generates useful tutorial(s) to prevent scientific errors that had previously caused paper withdrawal due to macroscopic miscalculation. (*MagLab contact: Chiara Tarantini, ASC*)

Lawrence Berkeley Laboratory, Accelerator, Berkeley, CA: The Applied Superconductivity Center is collaborating with the Lawrence Berkeley National Laboratory (LBNL) to test strain properties of high-performance RRP® Nb3Sn wires to be used in the LBNL Test Facility Dipole Project (TFD). This collaboration will explore the strain sensitivity of a specific Nb3Sn conductor to help LBNL researchers decide early in the project whether this conductor is suitable for TFD. (*MagLab contact: Najib Cheggour, ASC*)

Lawrence Berkeley National Laboratory, Berkeley, CA: The Applied Superconductivity Center is collaborating with the Lawrence Berkeley National Laboratory (LBNL) to heat-treat and test accelerator-type model coils (racetrack and CCT) based on Bi-2212 Rutherford cable conductor. (*MagLab contact: Daniel Davis, ASC*)

Lawrence Berkeley National Laboratory, Berkeley, CA: Construction of probes for measurement of the critical current of superconducting wires. (MagLab contact: Jun Lu, MST)

Lawrence Berkeley National Laboratory, Berkeley, CA: Measurement of critical current of Nb3Sn wires for Test Facility Dipole. (*MagLab contact: Jun Lu, MST*)

Lawrence Livermore National Laboratory, Livermore, CA: LLNL is a primary institution leading the Axion Dark Matter Experiment (ADMX), which is a search for dark matter in the universe. Discovery of evidence for dark matter would be a Nobel-class event, and many organizations are supporting dark matter searches including DOE, NASA, DOD, and NSF. This work focuses on the investigation of Nb3Sn coatings on copper materials for quantum detector cavities, which are the detector part of the larger experiment. (*MagLab contact: Lance Cooley, DIR*)

National Institute for Materials Science (NIMS), Japan: This collaboration investigates electromechanical properties of ultra-fine multifilamentary Nb3Sn ropes (developed by NIMS) to assess their strain tolerance and potential applicability of react-and-wind technique for using these conductors in applications. This work is part of a US-Japan Collaboration funded by USA (DOE, Office of Science) and Japan. (*MagLab contact: Najib Cheggour, ASC*)

National Institute of Materials Science and The University of Tokyo, Tsukuba & Tokyo, Japan: NIMS and the University of Tokyo have agreed to develop copper-silver-based conductors with strengths exceeding 900 MPa. This effort is performed to strengthen the supply chain of high-strength, high-conductivity materials that are critical to the pulsed magnet program. (*MagLab contact: Iain Dixon, MST*)

Oak Ridge National Laboratory, Knoxville, TN: We are collaborating with ORNL in the rare earth/critical mineral space. (*MagLab contact: Munir Humayun, RECMIB*)

Princeton Plasma Physics Laboratory, Princeton, NJ: The Applied Superconductivity Center and PPPL are collaborating on the R&D of high-field superconducting cable coil for use in nuclear fusion systems. In this context, a particular interest exists for CORC™-type cables made with REBCO conductors as well as Rutherford-type cables made with Bi-2212 wire. (*MagLab contact: Daniel Davis, ASC*)

Quantum Science Center, Oak Ridge, TN: National quantum center to develop quantum-classical hybrid computers leveraging high-performance computing and benchmark them with data from real quantum magnets. (*MagLab contact: Vivien Zapf, PFF*)

Radboud University High Field Magnet Lab, Nijmegen, Netherlands: The MagLab fabricated a 12.3 T Nb3Sn cable-in-conduit coil for a 45 T hybrid magnet to be housed at the HFML in The Netherlands. The coil has been delivered and the system is being assembled; the collaboration continues through final system testing. (*MagLab contact: Iain Dixon, MST*)

Thomas Jefferson National Accelerator Laboratory, Newport News, VA: Effort to understand fundamental aspects of niobium manufactured for superconducting radio-frequency cavities primarily for use in accelerators. (*MagLab contact: Shreyas Balachandran, ASC*)

University of Iceland, Reykjavik, Iceland: Design of highly effective DNP polarizing agents for the MAS-DNP platform. (*MagLab contact: Frederic Mentink-Vigier, NMR*)

US Conductor Procurement, Research, and Development Program, Berkeley, CA: CPRD supports the acquisition of conductor for accelerator magnet research primarily within the US Magnet Development Program. CPRD also supports the R&D of new conductors, superconducting materials, and associated processes via research contracts placed with US industries. CPRD is advised by a panel of experts from national laboratories and universities, including MagLab and ASC. (*MagLab contact: Lance Cooley, DIR*)

US Magnet Development Program, Batavia, IL: MDP advises about priorities and manages technology roadmaps for superconducting magnets used in particle accelerators. Support falls under the US Department of Energy, Office of Science, Office of High-Energy Physics, General Accelerator R&D program, which also funds other national laboratory activities and university groups including those at FSU and MagLab. The long-term view of MDP is highly synergistic with the scientific and technology development activities for user magnets and other partnerships. (*MagLab contact: Lance Cooley, DIR*)

US Magnet Development Program, Berkeley, CA: The US Magnet Development Program aggressively pursues the development of superconducting accelerator magnets that operate as closely as possible to the fundamental limits of superconducting materials and at the same time minimize or eliminate the need to break in a magnet in a series of steps to achieve its design field strength. MDP looks forward 15–30 years at accelerators that might be built. LBNL serves as the host institution for the MDP organization. (*MagLab contact: Dan Davis, ASC*)

US Muon Collider Collaboration, Batavia, IL: MagLab has common and synergistic interests in the development of high-field HTS and pulsed magnets that would be needed in an international project to design, develop, and build a muon collider at a European site. MagLab could be funded to perform some of the work. (*MagLab contact: Lance Cooley, DIR*)

UNIVERSITIES

Center for Doctoral Training, Cambridge, Oxford: This work formalizes the U.S. National High Magnetic Field Laboratory's partnership with the EPSRC Centre for Doctoral Training in Superconductivity, enabling structured student placements, joint workshops, guest lectures, and shared governance linking the MagLab with Oxford, Bristol, and Cambridge. It accelerates training and collaboration at the high-field superconductivity frontier—strengthening the pipeline in quantum materials research while speeding translation of HTS materials and magnet technologies into real-world impact in areas like fusion and healthcare. (*MagLab contact: Ali Bangura, DC*)

Center for Molecular Magnetic Quantum Materials, Gainesville, FL: Developing our understanding of quantum behavior of molecular magnets for eventual quantum information applications. (*MagLab contact: Vivien Zapf/LANL, PFF*)

Hokkaido University, Japan: The Applied Superconductivity Center is collaborating with Hokkaido University in the investigation of stresses and quench in cutting edge HTS world record magnets. (*MagLab contact: David Larbalestier, ASC*)

Lancaster University Low Temperature Physics Group and Ultra-Low Temperature Laboratories, Lancaster, UK: This informal arrangement involves expertise exchange concerning ultra-low temperature techniques, instrumentation and science. (*MagLab contact: Professor Mark Meisel, HBT*)

NASA University Leadership Initiative - Integrated Zero-Emission Aviation using a Robust Hybrid Architecture (IZEA), Tallahassee, FL: This is a multi-university and multi-industry partnership to envision, design, construct sub-scale components, and test components and systems related to passenger aircraft fueled by liquid hydrogen and using a distributed electrical propulsion system. The outcomes of work could facilitate emission-free passenger aviation in the second half of the 21st century. Members include MagLab, FSU-Center for Advanced Power Systems, Boeing, Raytheon, Advanced Magnet Lab, Georgia Tech. Univ., Univ. of Kentucky, Univ. of Tennessee - Knoxville, Illinois Institute of Technology, and the State University of New York at Buffalo. Synergies with MagLab include investigation of supercritical helium and hydrogen cryogenics, high-power superconducting cables, terminations and feedthroughs, and development of test facilities for cables and magnets that do not use liquid helium. (*MagLab contact: Lance Cooley, DIR*)

Penn State University, University Park, PA: Digital controls development for DCFF power supply active filter. (*MagLab contact: Julia H. Smith, DC*)

Seoul National University, Korea: The Applied Superconductivity Center is collaborating with SNU in the design and investigation of stresses and quench in cutting edge HTS world record magnets. (*MagLab contact: David Larbalestier, ASC*)

Tokyo University of Agriculture and Technology, Japan: This collaboration with TUAT focuses on the investigation of iron-based superconducting bulks and films to establish their intrinsic properties and determine their potential for applications using electromagnetic characterization techniques in the high field and with the expertise available at the MagLab. (*MagLab contact: Chiara Tarantini, ASC*)

University of Oxford, UK: This collaboration focuses the investigation of doped Nb3Sn superconducting wires and Fe-based superconductors (FBS) to determine by atom probe tomography the elemental distribution and possible contaminants (in the FBS) and their effect on the superconducting properties. (*MagLab contact: Chiara Tarantini, ASC*)

University of Padova, Padova, Italy: Development of platform for Dynamic Nuclear Polarization in Heterogeneous media. The collaborator has the expertise to synthesizes novel materials at the micro and nano scale, that can be functionalized to enable spin polarization transfer to enhance NMR detection sensitivity. (*MagLab contact: Tomas Orlando, EMR)*

Victoria University of Wellington, Lower Hutt, New Zealand: This work involves the publication of guidelines to correctly perform scientific analysis of experimental data relevant for superconductivity. This is neither a research nor educational activity, but it generates useful tutorial(s) to prevent scientific errors that had previously caused paper withdrawal due to macroscopic miscalculation. (*MagLab contact: Chiara Tarantini, ASC*)

COMMUNITY GROUPS AND EDUCATIONAL GROUPS

Applied Superconductivity Educational Foundation, Washington, DC: ASEF is the business incorporation that includes the Applied Superconductivity Conference, which is the leading conference in superconducting applications attended by ~50 MagLab faculty and staff every 2 years. The foundation oversees many education and outreach programs highly synergistic with MagLab's efforts, including the Human Levitator (co-owned by ASEF and the IEEE Council on Superconductivity) and short courses. (*MagLab contact: Lance Cooley, DIR*)

Big Bend/Leon Association of Science Teachers (BLAST), Tallahassee, FL: The Big Bend/Leon Association of Science Teachers (BLAST) is a group that brings together formal and informal science educators to establish lines of communication among all persons involved in science education in the North Florida community and foster a life-long interest in the sciences. They do this by coordinating services most conducive to outstanding science educators, including hosting workshops and presentations that aim to increase the knowledge and skills of science teachers. Additionally, they recognize outstanding achievements in science instruction and provide monetary support for science teacher and student projects. *(MagLab contact: Carlos R. Villa, CIRL)*
Florida A&M University Developmental Research School (FAMU DRS), Tallahassee, FL: FAMU DRS is the lab school of FAMU, a historically black college and university. The mission of FAMU DRS is to conduct research, demonstrations, and evaluations of the management of teaching and learning. FAMU DRS emphasizes mathematics, science, technology, and foreign languages. *(MagLab contact: Carlos R. Villa, CIRL)*

Florida Afterschool Network, Tallahassee, FL: The Florida Afterschool Network (FAN) is an organization that is working toward creating and sustaining a statewide infrastructure to establish collaborative public and private partnerships that connect local, state, and national resources supporting afterschool programs that are school-based or school-linked; develop quality afterschool standards that are endorsed and promoted by statewide stakeholders and through Florida Afterschool Network; and promote public awareness and advocate for policy that expands funding, quality improvement initiatives and accessibility of afterschool programs. The Center for Integrating Research & Learning is a member of the advisory council for this organization. *(MagLab contact: Carlos R. Villa, CIRL)*

Florida Association of Science Teachers (FAST), Tallahassee, FL: FAST is a diverse group of teachers, scientists, science educators, science supervisors, curriculum designers, administrators, and educational business partners who have a common goal of improving education for students in the state of Florida. FAST provides a way for all members to keep up with what is happening in education in Florida and across the United States. *(MagLab contact: Carlos R. Villa, CIRL)*

Future Physicists of Florida, Tallahassee, FL: Future Physicists of Florida is an organization dedicated to recognizing talented middle school math and science students and providing educational guidance to these students to prepare them for careers in physics and engineering. CIRL is a partner in the organization. *(MagLab contact: Carlos R. Villa, CIRL)*

Fusion Industry Association, Washington DC: The FIA is a non-profit organization composed of private companies and various other stakeholders including national laboratories and Universities working to make commercial fusion energy a reality. They provide multiple platforms and forums to rapidly exchange insight and information within the rapidly growing fusion space. FIA is driven by a passionate belief that affordable, clean energy is desperately needed in the world, and that fusion power is a viable solution. (*MagLab contact: Chris Segal, ASC*)

Inclusive Graduate Education Network, College Park, MD: The MagLab has worked with IGEN to beta test mentor training for mentors at national labs. MagLab staff have participated in the curriculum to strengthen the quality of mentorship at the MagLab through our Research Mentor Incubator Program. (*MagLab contact: Kawana Johnson, CIRL*)

Institute of Electrical and Electronic Engineers (IEEE) - Council on Superconductivity, Piscataway, NJ: The MagLab works with the IEEE Council on Superconductivity to oversee the major publications in applied superconductivity. (*MagLab contact: Lance Cooley, DIR*)

International Mentoring Association, Newberry, FL: This organization is a leading source for best practice solutions and support of mentoring and coaching professionals and their programs. The IMA advances individual and organizational development by promoting the use of mentoring best practices in every organizational setting. CIRL staff benefit from the professional development that this organization provides. (*MagLab contact: Kawana Johnson, CIRL*)

Leon County Schools, Tallahassee, FL: CIRL works closely with Leon County Schools (LCS) through our K-12 outreach and our middle school mentorship program. In 2014, CIRL staff worked with Title I elementary school teachers from LCS to develop and facilitate a year-long teacher professional development that culminated in a STEM challenge for students. *(MagLab contact: Carlos R. Villa, CIRL)*

Lively Technical College, Tallahassee, FL: Lively Technical College has supported the MagLab in our efforts to introduce skilled technical workers in training to career pathways in STEM at a National Lab. They have also worked with us in exploring grant opportunities that could expand this work. (*MagLab contact: Kawana Johnson, CIRL*)

National Girls Collaborative Project, Seattle, Washington: This is a national nonprofit organization that works to improve girls' interest in and access to STEM programs and careers. CIRL has utilized its publications and webinars for best practices in STEM education. (*MagLab contact: Roxanne Hughes, CIRL*)

National Postdoc Association, Washington, DC: The NPA advocates for postdoctoral scholars at a national level and coordinates an annual meeting of postdoctoral scholars, their mentors, and postdoctoral affairs staff. The NPA provides direct support to postdocs through professional development and a virtual career center. (*MagLab contact: Kawana Johnson, CIRL*)

2. USER FACILITIES

2.1 USER PROGRAM

PROPOSAL REVIEW PROCESS

Across all seven MagLab facilities, proposals for magnet time are submitted online via https://users.magnet.fsu.edu and reviewed in accordance with the MagLab User Proposal Policy. Each facility has a User Proposal Review Committee (UPRC) composed of at least seven members, with a majority being external to the lab. UPRC memberships are kept confidential by the laboratory but are available for review by the NSF and MagLab advisory committees.

Proposal evaluations are conducted in strict confidence and are based on two primary criteria:

- **Scientific and/or technological merit** of the proposed research
- **Broader impacts** of the proposed work

Proposals are graded online using a scale from:

A–Proposal is high quality and magnet time must be given a high priority
B–Proposal is good quality and magnet time should be granted
C–Proposal is acceptable and magnet time should be granted at MagLab discretion
D–Proposal has minimal merit and granting magnet time should be a low priority
F–Proposal has little/no merit and magnet time should not be granted.

Facility Directors integrate UPRC recommendations with the availability of magnets, experimental instrumentation, and user support resources to make scheduling recommendations to the MagLab Director. Final decisions on magnet time assignments are made by the MagLab Director based on these recommendations.

All 2025 User Proposals are listed in **Appendix 5**.

FUNDING OPPORTUNITIES

Dependent Care Travel Grant

The MagLab recognizes that caregivers of children and other dependents often shoulder these demands in addition to the challenges of their research careers. For caregivers, travel to the MagLab to conduct experiments or to conferences to disseminate research findings often incurs extra costs for dependent care. Since 2011, the MagLab's Dependent Care Travel Grant (DCTG) program has offered up to $800 per year for travel expenses for MagLab scientists traveling to conferences or MagLab users traveling to any of the three MagLab facilities. In 2025, the MagLab proudly granted $800 to a staff research technician from LANL, so that she could attend advanced CAD training. She utilized this training to design a helium recovery system for the LANL facility.

First-Time User Support

The National High Magnetic Field Laboratory (NHMFL), supported by the National Science Foundation, provides world-class facilities for magnet-related research. These facilities are open to all qualified scientists and engineers through a competitive, peer-reviewed proposal process. Access to the facilities is generally provided at no cost to users.

To encourage new research and broaden participation, NHMFL offers travel support for first-time users. Domestic researchers may receive up to $500, and international researchers up to $1,000, to offset travel expenses. This funding is provided by the State of Florida and applies exclusively to NHMFL facilities located in Tallahassee.

Visiting Scientist Program (VSP)

The National High Magnetic Field Laboratory provides researchers from academia, industry, and national laboratories the opportunity to utilize the unique, world-class facilities of the laboratory to conduct magnet-related research. In 2025, the Visiting Scientist Program provided financial support of $94,281 for 14 research projects on a competitive basis. To apply for support from the Visiting Scientist Program, interested researchers are required to submit an application and a proposal that is reviewed by appropriate facility directors and scientists at the NHMFL. All requests for support must be submitted online at https://vsp.magnet.fsu.edu/.

User Collaboration Grants Program (UCGP)

The National Science Foundation charged the National High Magnetic Field Laboratory with developing an internal grants program that utilizes the MagLab facilities to carry out high-quality research at the forefront of science and engineering and advances the facilities and their scientific and technical capabilities. User Collaboration Grants Program stimulates magnet and facility development and provides intellectual leadership for research in magnetic materials and phenomena.

The Program strongly encourages collaboration between MagLab scientists and external users of

MagLab facilities. Projects are also encouraged to drive new or unique research, i.e., serve as seed money to develop initial data leading to external funding of a larger program. Per NSF policies, the MagLab cannot fund clinical studies.

In the past 20 years, 324 proposals were submitted with 93 proposals funded at a total of $18,405,749. These grants resulted in the user facility enhancements shown in **Table 2.1.2** as well as publications and student support as detailed below.

2025 Solicitation Skipped

The most recent UCGP solicitation was held in 2024; there was no solicitation in 2025 due to uncertainty about the laboratory's funding position. As a result, no UCGP awards were split between existing and renewed MagLab core grants. Outcomes from the last five UCGP solicitations, including 2025 work done on existing grants has been summarized below.

The next UCGP solicitation is expected to be announced in 2026. Awards from the 2026 solicitation are anticipated to be announced by the end of the year, with funding made available in early 2027.

Results Reporting

To assess the success of the UCGP, reports were requested in January 2026. Twenty-two grants were issued across five solicitations, with start dates ranging from 2019 through 2024. At the time of the reporting, some of these grants were in progress, and some had been completed. For this "retrospective" reporting, PIs were asked to include external grants, MagLab facilities enhancements, and publications that were generated by the UCGP. Since UCGP grants are intended to seed new research through high-risk initial study or facility enhancements, principal investigators (PIs) were allowed and encouraged to report results that their UCGP grant had made possible, even if these were obtained after the term of the UCGP grant was complete.

The PIs reported:

- 48 lab enhancements, which are listed in **Table 2.1.2**.
- At least partial support for 6 high school students, 22 undergraduate researchers, 22 grad students, and 10 postdocs.
- 5 funded external grants, which were seeded by results from UCGP awards. The total dollar value of the external grants was $4.8M.

148 publications, many in high-profile journals, including *3 PNAS, 21 Physic Reviews, 9 JACS, 1 Nature, 7 Nature Communications, 4 Nature Physics, 1 Nature Materials, 1 Nature Partner Journals (npj) Quantum Materials, 1 Nature Catalysis, 1 Nature Chemistry, and 2 Science.*

Table 2.1.2. *Facility Enhancements Reported from the last five UCGP Solicitations*

Enhancement	Date Available	Users Groups*
ARS Cryocooler System for Parahydrogen Enrichment to 99%	6/1/2021	9
Rapid high-resolution temperature dependence of heat capacity	6/1/2022	9
Magnetometer for Large Magnet Moments with Strong Magnetic Anisotropy	6/1/2021	8
High resolution angle dependent heat capacity	12/1/2022	8
New 9T wide bore magnet replacement and integration	11/1/2024	8
Upgrade of control software with more experimental control options	11/1/2024	8
Lowered electron temperature in dilution fridge >300 mK to <30 mK	6/1/2021	7
Rapid field sweeping measurement of heat capacity, up to 5T/min	1/1/2022	6
Packed Bed Heterogeneous Catalytic Reactor for Continuous-Flow Hyperpolarization	5/1/2022	6
High resolution heat capacity <0.01pJ/K^2	6/1/2022	6
Ultrasonic Spray Injection Reactor System	6/1/2022	5
Batch Catalytic Reactor System with Automated NMR Acquisition	2/1/2023	5
Pulsed EPR at 395 GHz.	1/1/2021	4
Low-pass filters for ultra-low electron temperatures	11/29/2021	4
Razorbill piezoelectric uniaxial strain/stress	5/31/2019	3
Online liquid chromatography for environmental applications (metal and organic speciation)	9/1/2022	3
Radio Frequency pulse control within HiPER	2/1/2023	3

Enhancement	Date Available	Users Groups*
New 10W solid state amplifier, full integration	11/1/2024	3
New 2D DNP capabilities	12/15/2025	3
Tuning fork thermometer software	12/1/2021	2
Continuous-Flow Polarization of Metabolites	6/1/2025	2
Ultra-low temperature NMR spectrometers at Bay 2 of High B/T facilities	1/31/2020	1
PEPPI-MS fractionation	6/6/2020	1
Superconducting cable critical current measurement by using a superconducting transformer	8/1/2021	1
In-house designed and built piezoelectric strain device for pulsed fields	8/1/2021	1
THz time-domain spectroscopy in pulsed magnetic fields	10/1/2021	1
Developed diamond anvil cell for pulsed fields	1/1/2022	1
Magneto-Raman spectroscopy at temperatures down to 2K and high pressures up to 20GPa	3/1/2022	1
We now have a trace-metal free LC system that can operate at low flow rates	9/1/2022	1
Ultimate3000 LC system, with low flow rate capability	9/1/2022	1
New capability for the measurement of dilation with 10x improved sensitivity	10/31/2022	1
Ability to measure and separate different components of heat capacity using frequency dependence	1/1/2023	1
Ability to measure spin-lattice relaxation rate using heat capacity	1/1/2023	1
Significant noise and electron temperature reduction in systems across the lab, including the PDF, SCM2	8/1/2025	1
Developed technical skills in technicians related to PDC board design probe development noise and thermalization and probe performance improvements across the board	8/1/2025	1
GUPPI Software	12/20/2020	0
Auto locate Fragments Software	12/20/2020	0
Manual Validation Helper Software	12/20/2020	0
Tuning fork 3He cell thermometers	3/1/2022	0
Data acquisition system suited for Data Independent Acquisition	11/21/2022	0
Faraday force magnetometry	11/30/2022	0
Miniature tuning fork thermometers	12/1/2022	0
Thermo Scientific Eclipse Instrument (used to upgrade 21 T)	1/3/2023	0
In situ EPR in the MAS-DNP 600 MHz NMR setup	8/1/2023	0
REBCO torque magnetometry at 45 T	7/15/2025	0
REBCO critical current characterization at any angle between current and field	7/15/2025	0
Temperatures less than 10 mK are available in the cryogen-free system	8/1/2025	0
Low deadtime EPR measurements (new laser switch system)	9/1/2025	0

** Number of external users (PIs or private companies only) reported to have used the enhancement.*

ANNUAL USER PROGRAM SURVEY

The MagLab conducted its annual user survey between June 2, 2025, and June 30, 2025. This survey is vital for guiding the MagLab in setting priorities and planning for the future, as it helps all seven facilities respond to user needs and improve their services and infrastructure. The survey was distributed to all MagLab User Principal Investigators (PIs) and their collaborators who received magnet time between June 1, 2024, and May 31, 2025, including PIs who sent samples for experiments conducted by laboratory staff scientists.

To assess engagement across our user base, a survey was distributed to a total of 935 eligible users. The response rate was modest, with 180 individuals participating, yielding an overall response rate of 19.25%. A closer examination of the respondent demographics reveals a significant disparity between

internal and external users. Internal users—defined as those affiliated with Florida State University (FSU), the University of Florida (UF), and Los Alamos National Laboratory (LANL)—accounted for 40 responses, representing 4.28% of the total eligible population and 22.22% of all responses received. In contrast, external users contributed 140 responses, which equates to 14.97% of the total eligible users and 77.78% of the total responses.

Overall, the survey results offer valuable data on user engagement and highlight the importance of tailoring outreach efforts to different segments of the user base. Continued analysis and follow-up may help uncover underlying factors influencing response behavior and guide improvements in future survey initiatives.

All user responses were treated as confidential. **Figures 2.1.1-2.1.3** exclude internal responses. Breakdowns by facilities can be found at User Satisfaction - MagLab.

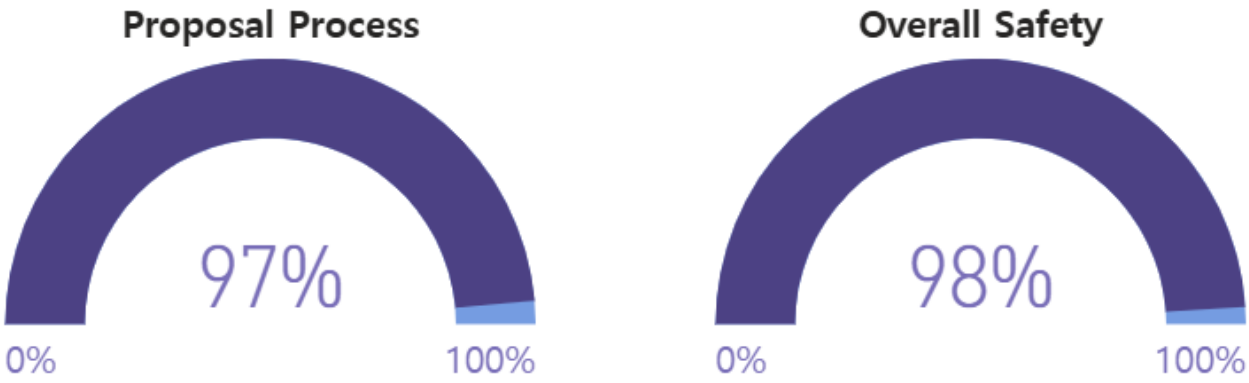

Figure 2.1.1. Links. *97% of external users were satisfied or very satisfied with the proposal process (e.g., submission, review).* ***Right.*** *98% of external users were satisfied or very satisfied with the overall safety at the MagLab.*

Figure 2.1.2. Left. *97% of external users were satisfied or very satisfied with the performance of the facilities and equipment.* ***Right****: 95% of external users were satisfied or very satisfied with the availability of the facilities and equipment.*

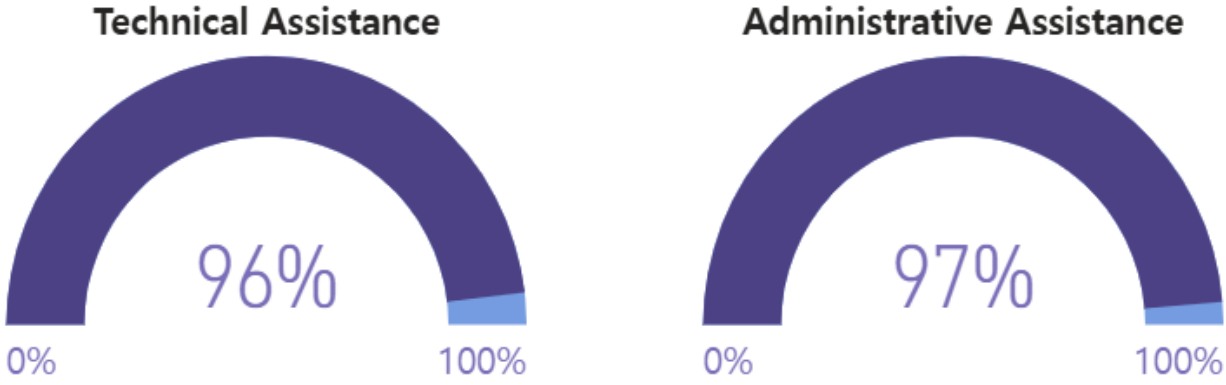

Figure 2.1.3. Left. *96% of external users were satisfied or very satisfied with the assistance provided by MagLab facilities technical staff.* ***Right.*** *97% of external users were satisfied or very satisfied with the assistance provided by MagLab facilities administrative staff.*

2.2 AMRIS FACILITY

The AMRIS Facility at the University of Florida supports nuclear magnetic resonance spectroscopy (NMR) and magnetic resonance imaging (MRI) studies of chemical compounds in a range of contexts, including micro-samples, biomolecular systems, tissues, small animals, large animals, and humans. We also offer state-of-the-art imaging of humans, animals, and plants, including functional imaging, flow measurements, neuroimaging, cardiac imaging, and modalities enabled by hyperpolarization. We also support studies in materials research, which depend upon ultra-high spatial resolution MRI. AMRIS supports fourteen systems with different magnetic fields and configurations as requested by users for magnetic resonance experiments. The AMRIS staff includes 14 professional staff members to assist users, maintain instrumentation, build new coils and probes, and help with administration.

OPERATION OF A WORLD-LEADING HIGH-MAGNETIC-FIELD USER PROGRAM

Unique Aspects of Instrumentation Capability

AMRIS Magnetic Resonance instruments **(Table 2.2.1)** offer users unique capabilities particularly focused on applications in chemistry and biology: the 750MHz wide bore provides outstanding high-field imaging for excised tissues and small animals as well as diffusion measurements with gradient strengths up to 30T/m; the 11.1T horizontal MRI has a large 400mm bore size and gradient strengths up to 1T/m; our solution NMR instruments have state-of-the-art cryoprobes for natural products, structural biology, metabolomics, and metabolic flux measurements in perfused organs; two dissolution DNP polarizers are available for *in vivo* measurements of metabolic flux; a Xenon polarizer is available for lung imaging. Four spectrometers are now equipped with state-of-the-art Bruker NEO hardware, which supports multichannel transmit and receive experiments. These systems support a broad range of science, including natural product characterization/identification, membrane protein structure determination and dynamics investigations, cardiac studies in animals and humans, and the correlation of neural structures with brain function and chemistry**.** We note that due to decreased funding from the NSF for NMR/MRI user support, our 3.0T MRI/S scanners, 7.0T 200mm MRI/S scanner purchased with an NIH grant in 2022, one 600MHz NMR system, and 500MHz NMR system no longer receive support from the MagLab user program and will no longer be included in annual reporting. These instruments are available on a fee-for-service basis and will continue to be independently administered by the AMRIS Facility. Despite this, the AMRIS NSF-funded user program offers a world-unique combination of ultra-high field MRI and NMR magnets for a wide range of applications as shown in the table below.

Table 2.2.1. *AMRIS Facility NMR and MRI Systems that are available through the MagLab User Program.*

^{1}H Frequency	Field (T), Bore (mm)	Homogeneity	Measurements
800MHz	18.8, 63	1ppb	Solution/solid-state NMR and HR-MAS
800MHz	18.8, 54	1ppb	Solution NMR (Cryoprobe)

CARRYING OUT IN-HOUSE RESEARCH AND SCIENTIFIC INSTRUMENTATION DEVELOPMENT IN SUPPORT OF THE USER PROGRAM

Facility Developments and Enhancements

A ^{2}H cryocoil (and related room-temperature coils) is being developed to enable metabolic flux measurements in tandem with proton MRI/S measurements on the 11.1T instrument through funding from a UCGP grant. All of our vertical bore systems can be operated remotely, with users sending samples to AMRIS staff. A new 3.2mm e-free MAS probe constructed by the MagLab is available to the user program on the 800MHz 63mm system, further enhancing the solid-state NMR capabilities. This probe has been further upgraded, with a range of swappable ‘tuning cards’, allowing for a wide range of X nuclei to be studied. This upgrade complements existing 1.3 – 4mm MAS probes, including a 1.9mm HFXY probe and 4mm BB MAS probe, allowing for a wider range of MAS experiments. Continued updates to the acquisition and processing software have greatly improved AI-based processing of NMR data and allow for more automated batch processing.

Major Research Activities and Discoveries

Many of our users take advantage of remote access for data collection. Outstanding staff scientists provide on-site support for users who choose to send samples and remotely control the spectrometers to collect data. This is working well for structural biology experiments, high-resolution *ex vivo* MRI measurements, and diffusion studies of materials. The majority of users onsite are conducting *in vivo* studies that require their presence. Local graduate students and postdoctoral fellows continue to develop DNP hyperpolarization and *in vivo* spectroscopy techniques for metabolic studies. AMRIS facility users reported 31 peer-reviewed publications and 17 theses and dissertations during 2025 from magnet time provided through the NSF user program. Two highlights from the publications and graduate research projects are listed below. We note that beginning in 2023, these publications are only for instruments that receive some of their support from the NSF user program; an additional 43 publications were reported from our magnet systems available on a fee-for-service basis.

Uncovering Novel Carbocation Dynamics in Terpene Biosynthesis

Xiuting Wei[1]; William DeSnoo[2]; Zining Li[1]; Wenbo Ning[1]; Wang-Yeuk Kong[2]; Jordan Nafie[3]; Dean J. Tantillo[2]; Jeffrey D. Rudolf[1]

***Funding**: J. D. Rudolf (NIH R35 GM142574); D. J. Tantillo (NIH R35 GM153469, NSF ACCESS program)*

***Citation:** Wei, X.; DeSnoo, W.; Li, Z.; Ning, W.; Kong, W.; Nafie, J.; Tantillo, D.J.; Rudolf, J.D., Avoidance of Secondary Carbocations, Unusual Deprotonation, and Nonstatistical Dynamic Effects in the Cyclization Mechanism of Tetraisoquinane, J. Am. Chem. Soc., 147 (19), 16293-16300(2025)* doi.org/10.1021/jacs.5c01828

Terpenes represent one of the largest and most diverse classes of natural products with critical biological functions and applications across medicine and agriculture. The complexity of these molecules arises from enzyme-catalyzed cyclization reactions that manage highly reactive carbocation intermediates. However, the precise mechanisms by which these enzymes control such reactive species to yield specific products remain poorly understood, particularly for rare and complex terpene skeletons.

This team of chemists and biochemists has conducted the first mechanistic study of tetraisoquinene biosynthesis by TiqS, a diterpene synthase from the myxobacterium *Melittangium boletus*. By combining minor metabolite isolation, deuterium labeling, site-directed mutagenesis, and quantum chemical calculations, the researchers uncovered unusual deprotonation pathways and nonstatistical dynamic effects that direct the formation of the unique 5/5/5/5-fused ring system. Their work also demonstrates how the enzyme prevents the formation of secondary carbocations during the complex rearrangement of the carbon skeleton.

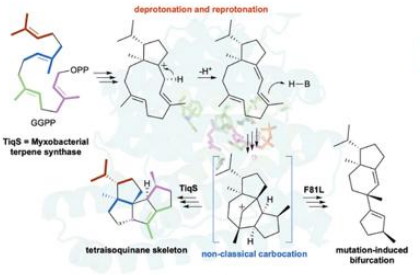

Figure 1 (left): TiqS-catalyzed biosynthesis of tetraisoquinane from GGPP. The myxobacterial terpene synthase transforms GGPP through a series of cyclizations, deprotonation-reprotonation events, and a non-classical carbocation intermediate. The complex reaction pathway showcases how enzymes guide carbocation chemistry to form specific products and can be redirected through strategic mutations to produce alternative scaffolds.

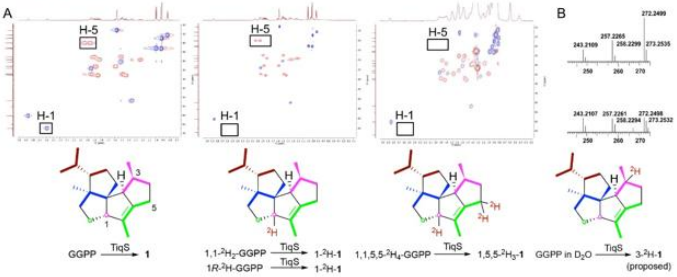

Figure 2 (above): Deuterium-labeled GGPP supports isoprene units and C-1 rearrangement. (A) Incubation of TiqS with unlabeled GGPP, 1,1-$^2H_2$-GGPP, 1R-^{2}H-GGPP, and 1,1,5,5-$^2H_4$-GGPP gave **1**, 1-^{2}H-**1**, 1-^{2}H-**1**, and 1,5,5-$^2H_3$-**1**, respectively, with zoomed-in ^{1}H-^{13}C HSQC spectra shown above each structure. (B) Incubation of TiqS with unlabeled GGPP in D_2O increased the molecular weight of **1** by one mass unit, supporting the proposed mechanism.

This work offers fundamental insights into nature's strategies for terpene cyclization and provides a framework for understanding related transformations in other systems. The findings could facilitate engineering terpene synthases for novel bioactive compounds, especially since the tetraisoquinane scaffold represents a previously unexplored structure with promising biological activities.

Development of an In Situ G Protein-Coupled Receptor Fragment Molecule Screening Approach with High-Resolution Magic Angle Spinning Nuclear Magnetic Resonance

Enzo Petracco[1], Guillaume Ferré[1], Ivo Kabelka[2], Flavio Ballante[2], Jens Carlsson[2], Emma Mulry[1], Arka P. Ray[1], James Collins[1], Florent Allais[1], and Matthew T. Eddy[1]

Citation: *Petracco, E.; Ferré, G.; Kabelka, I.; Ballante, F.; Carlsson, J.; Mulry, E.; Ray, A.P.; Collins, J.H.; Allais, F.; Eddy, M.T., Development of an In Situ G Protein-Coupled Receptor Fragment Molecule Screening Approach with High-Resolution Magic Angle Spinning Nuclear Magnetic Resonance, ACS Chemical Biology, 20 (2), 401-411 (2025)* doi.org/10.1021/acschembio.4c00686

Over 4,000 proteins not targeted by current drugs have been identified as potential therapeutic targets, many of which are G protein-coupled receptors (GPCRs). Conventional drug screening methods rely on labeled ligands that are expensive or not commercially available, limiting which proteins can be studied. Additionally, these methods overlook lower-affinity molecules that provide leads for ultimately developing drug-like compounds.

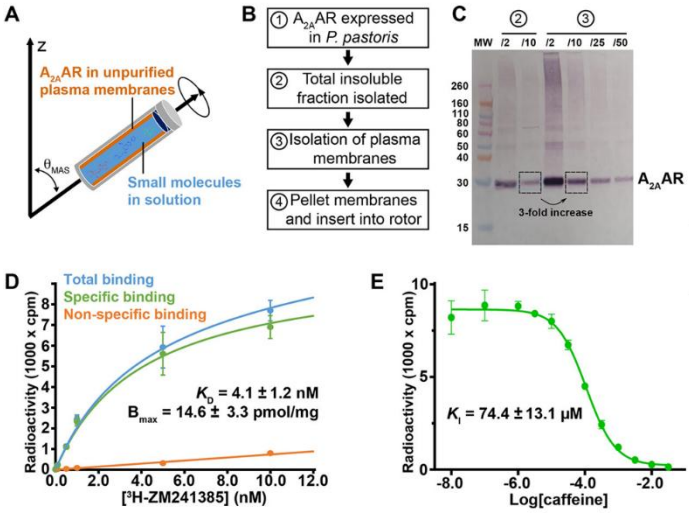

Figure: *(**A**) A diagram of the HRMAS rotor, showing membranes with A2AAR and small molecules in solution. (**B**) Optimized sample preparation workflow (**C**) Western blot quantification of $A_{2A}AR$ that validates the workflow described in (B). (**D and E**) Ligand binding data demonstrating that the workflow results in active protein samples.*

This study demonstrated a proof-of-concept application of high-resolution magic angle spinning nuclear magnetic resonance (HRMAS NMR) spectroscopy for screening for small molecules that bind the human A2A adenosine receptor (A2AAR), a GCPR target for Parkinson's disease and several cancers. Researchers developed a novel workflow to prepare plasma membranes enriched with A2AAR without the need for detergent purification, which is often required in conventional experiments. This improved the sensitivity of NMR experiments while maintaining a native-like cellular environment of the plasma membrane. Researchers then used known investigational molecules such as caffeine to validate their approach before applying their method to identify novel chemical scaffolds that interact with the receptor and serve as starting points for new drug discovery.

Beyond GCPRs, HRMAS NMR could be applied to lipid-based nanoparticles, biodegradable polymeric nanoparticles, protein-excipient interactions, and antigen-adjuvant binding in drug formulations. Additionally, the method applied in this study should be readily adapted for GPCRs and other membrane proteins expressed in mammalian cells and other cell systems, underscoring its broad applicability.

MAINTAINING FACILITY AND DEVELOPMENT OF NEW MAGNET SYSTEM INCLUDING OPERATION SCHEDULE AND SHUTDOWNS

Facility Plans and Directions

Despite the ongoing challenging budgetary climate, our users have consistently and successfully pursued federal funding to support their research programs. This support extends to assisting the AMRIS facility in writing proposals to upgrade instrumentation. The successful partnership between the MagLab user program and individual investigator research grants provides constant scientific motivation for our technology development. One capability of particular focus is enhancing our cryocooled NMR probes and MRI coils to greatly increase sensitivity. To this end, we are supporting the maintenance of conventional NMR cryoprobes as well as HTS NMR cryoprobes developed through our NIH-funded technology center for NMR probe development, the development of a ^{2}H MRI/S cryocoil for our 11.1T MRI/S scanner through a UCGP, and the initiation of a construction project for a new 3 mm HTS cryoprobe. The new 3mm HTS cryoprobe, along with our commercial 1.7mm Micro-Cryoprobe, will cover a large range of solution volumes from 30 to 180 microliters for natural product and metabolomic-type samples. We are also boosting Low-E MAS probe capabilities at 800MHz with the construction of 1.6- and 3.2-mm probes for recently added NMR systems. The 800MHz 3.2mm probe is now available for users, with a variety of tunning cards options: HCN, HCSi or HPC. The latest generation Bruker HRMAS iProbe is also now available for users and has greatly improved usability for faster sample changing with automated magic-angle adjustment and upgraded gradient and RF coil design for better signal-to-noise and pulse sequence performance to further improve fresh tissue NMR; microwave tissue preservation capabilities were also added at UF. As we recover helium, costs for using these systems remain low, allowing us to continue to support technological developments. We also received an NSF MRI Track 3 award to upgrade our aging helium recovery capabilities. A (new to this facility) 800MHz is planned for installation in the location of the retired 4.7T MR system. It will support MAS experiments using specially constructed Low-E MAS probes, and reuse much of the retired 750MHz console.

Facility Operation Schedule
The AMRIS facility operates all year, except during the last week of December when the University of Florida is open only for essential operations. Vertical instruments for ex vivo samples are scheduled 24/7, including holidays and weekends. Horizontal instruments operate primarily 8-10 hours/day, 5 days/week due to the difficulty in running animal or human studies overnight, except the 11.1T scanner, which operates 7 days a week due to oversubscription. During 2025, the AMRIS Facility was in full operation, with demand continuing to increase post-COVID.

CONDUCTING EDUCATION AND OUTREACH ACTIVITIES

The MagLab facilities at the University of Florida conduct their own educational programs, which are currently facilitated by Eli Wolf and Nicolas Silva. During the 2025 calendar year, staff from the AMRIS and High B/T MagLab facilities gave 17 tours of the facility to 276 people. These tours included K-12 students, graduate and undergraduate students, visiting scientists, and community members. By tabling at events and conducting presentations, AMRIS and High B/T staff were able to reach an additional 412 researchers, K-12 students, and members of the general public. MagLab staff at UF also hosted and coordinated SEMRC, a conference attended by 120 scientists, a majority of whom were undergraduate or graduate students. We also hosted our annual RF Coil Workshop to train graduate scientists in the design and construction of MRI coils.

2.3 DC FIELD FACILITY

The DC Field Facility in Tallahassee serves a diverse and global user community by delivering continuously variable magnetic fields with a range and quality unmatched anywhere in the world. Our user base includes undergraduate and graduate students, postdoctoral researchers, and senior investigators from across the nation and internationally. Through the expertise of our scientific and technical staff, state-of-the-art instrumentation is developed and seamlessly integrated with our facility's magnet systems. Users receive comprehensive support - scientific, technical, and administrative - throughout their visit to ensure their magnet time is maximally productive. The collaboration between NHMFL staff and visiting researchers fosters a dynamic exchange of scientific ideas and advanced techniques, creating a continuous flow of innovation that benefits both the facility and its users.

2. *Higher homogeneity magnet for magnetic resonance measurements.*
3. *Optical ports at the field center with 4 ports each 11.4° vertical x 45° horizontal taken off of a 5mm sample space.*
4. *Quantum Design PPMS and MPMS user "on-ramp" magnet systems.*

Table 2.3.1 summarizes the magnets available at the DC Field Facility. The MagLab is the global leader in continuous magnetic field strength, the number of high-field DC magnets accessible to users, and the accessibility of its resources for scientific research. Our flagship 45T hybrid magnet, commissioned in 1999, remains one of only two such magnets worldwide—the second was introduced in 2022 at the Chinese High Field Facility. The 41.5T resistive magnet offers magnetic fields approaching hybrid-level performance while maintaining user-friendly operational characteristics. The 36T Series Connected Hybrid magnet provides two configurations: a 40mm bore with 1 ppm homogeneity for chem/bio-NMR experiments, and a 48 mm bore with 20ppm homogeneity for condensed matter physics in a top-loading cryogenic system. The 35T (32mm bore) and 31T (50mm bore) workhorse resistive magnets deliver exceptional technical performance, flexibility, and ease of use, continuing to drive significant scientific discoveries. The 25T Split-Helix magnet

is the highest-field direct optical access and scattering magnet in the world. Featuring four optical ports at field center—each with an 11.4° vertical × 45° horizontal view through a 5mm opening—it enables ultrafast, time-resolved, and x-ray scattering experiments at unprecedented magnetic fields.

CARRYING OUT IN-HOUSE RESEARCH AND SCIENTIFIC INSTRUMENTATION DEVELOPMENT IN SUPPORT OF THE USER PROGRAM

Facility Developments and Enhancements

Replacement of Second-Generation Resistive Magnet Protection Systems

The DCFF Electronics Shop has continued the process of installing the second-generation resistive magnet protection systems (RMPS II, **Figure 2.3.1**). These systems continuously monitor a number of water-cooled magnet characteristics (voltage, current, water temperature, coil temperature, water pressure, etc.), and if any of the monitored quantities exceed the predetermined limits the computer sends a signal to the power supplies to shut down, protecting the magnet and ancillary equipment. The RMPS II software runs on a field programmable gate array (FPGA) computer which allows it to acquire data and act at high speeds. The RMPS II systems have now been installed in Cells 5, 6, 7, 8, 9, 12 and 15, completing a multi-year upgrade of our resistive magnet protection systems, significantly enhancing operational reliability and user safety. These improvements reduce downtime, extend magnet lifespan, and ensure uninterrupted delivery of world-class magnetic fields for scientific research.

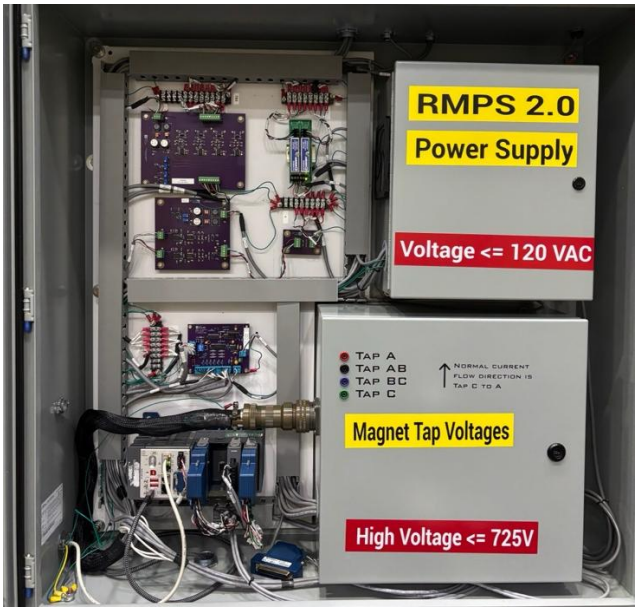

Figure 2.3.1 *Picture of the electronics of a second-generation resistive magnet protection system.*

Commissioning of High-Capacity Magnet Cooling Water Loops

The DCFF employs six magnet cooling water pumps connected to two independent cooling loops (**Figure 2.3.2**). In 2025, the DC Field Facility completed and commissioned a significant multi-year upgrade to its magnet cooling water system, enhancing both capacity and resilience. The system now features two *equivalent* cooling loops, each capable of moving 4,500 gallons per minute, supported by four 500HP pumps and two high-capacity pumps rated at 800HP and 900HP—all equipped with variable speed drives. These new drives are engineered to withstand the elevated environmental temperatures experienced during summer months, ensuring reliable performance under demanding conditions. This upgrade not only improves operational robustness against pump and VSD failures but also positions the facility for future expansion, including the ability to operate two 36MW magnets in parallel following the upcoming power supply upgrade. These improvements underscore the MagLab's commitment to reliability, scalability, and world-class research capability.

Figure 2.3.2 *Primary magnet cooling water pumps and variable speed drives in the DCFF water-cooling plant.*

Recommissioning and Enhanced Capabilities of the Portable Dilution Refrigerator

In 2025, the DC Field Facility recommissioned its portable dilution refrigerator for use in Cell 8 (35T, 32mm bore), selected to maximize the noise reduction potential for demanding low-electron-temperature measurements. A comprehensive overhaul was performed after inspection revealed numerous vacuum leaks that had degraded system performance. The entire cryostat was disassembled and all perishable components, including O-rings and indium seals, were replaced. A new probe was constructed with improved thermalization of twisted-pair wiring and coaxial cables at the 1K pot stage, and a custom RC filter board with a 100kHz roll-off was installed to enable the low-frequency AC measurements required for two-dimensional electron gas (2DEG) experiments (**Figure 2.3.3)**. The number of available measurement

wires was increased from 24 to 32 by adapting the breakout box design used across our other cryogenic systems, and a new sample platform was developed to support wire bonding.

Initial transport measurements on FIB-prepared CeRh2As2 microcrystals, provided by collaborators at Los Alamos National Laboratory (Joanna Blawat), demonstrated the importance of the filtering upgrades — superconducting transitions were only resolved after the RC filters were installed. Subsequent experiments on twisted bilayer WTe2 (Pengjie Wang, University of Illinois) and rhombohedral graphene (Zhengguang Lu, Florida State University) confirmed that the system achieves electron temperatures below 100 mK, benchmarked against known superconducting transitions observed in well-filtered laboratory-based dilution refrigerators. This is a notable achievement given the 14.5 mm sample space constraints of a top-loading system operating in a high-power resistive magnet environment. Based on these results, a two-week scheduling model has been adopted as standard for portable dilution refrigerator experiments: the first week uses one power supply for system initialization and noise optimization, while the second week adds the second power supply for full-field measurements.

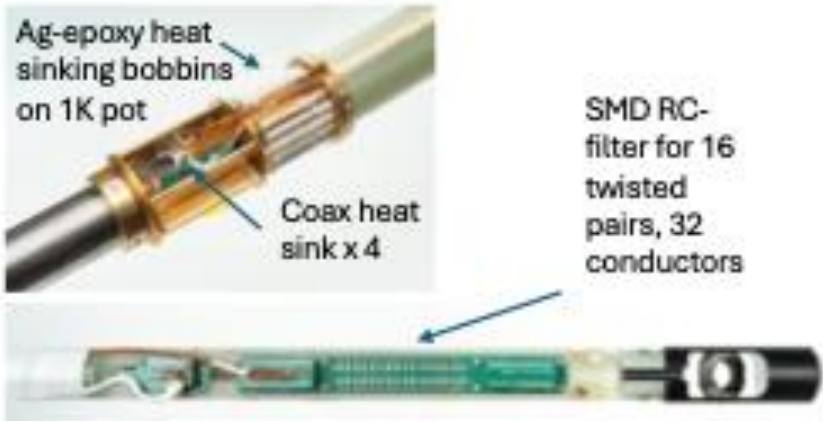

Figure 2.3.3 *Above: Twisted pair filtering stage anchored at 1K pot. Bottom: one-axis rotator with custom low-T RC filter for the lowest possible electron temperatures ~100mK.*

Major Research Activities and Discoveries

Unconventional Gapping Behaviour in a Kagome Superconductor

The Kagome - lattice superconductor CsV3Sb5 has attracted intense interest owing to its interplay of charge order, topology, and superconductivity. In this material, multiband superconductivity coexists with a charge-density wave that substantially reduces the space group symmetries. Using a combination of electrical transport, thermal transport, and high-resolution heat capacity measurements performed in supercond-ucting magnets SCM 1 and SCM 2 at the DC Field Facility, the research team identified two distinct superconducting regimes characterized by different transport and thermos-dynamic signatures. A substantial quasiparticle weight is present in the higher-temperature regime and is progressively removed as a second gap opens at lower temp-eratures, without an intervening phase transition. This band-selective superconductivity, in which the two gaps are remarkably decoupled from one another, has not been observed in any other known material. The

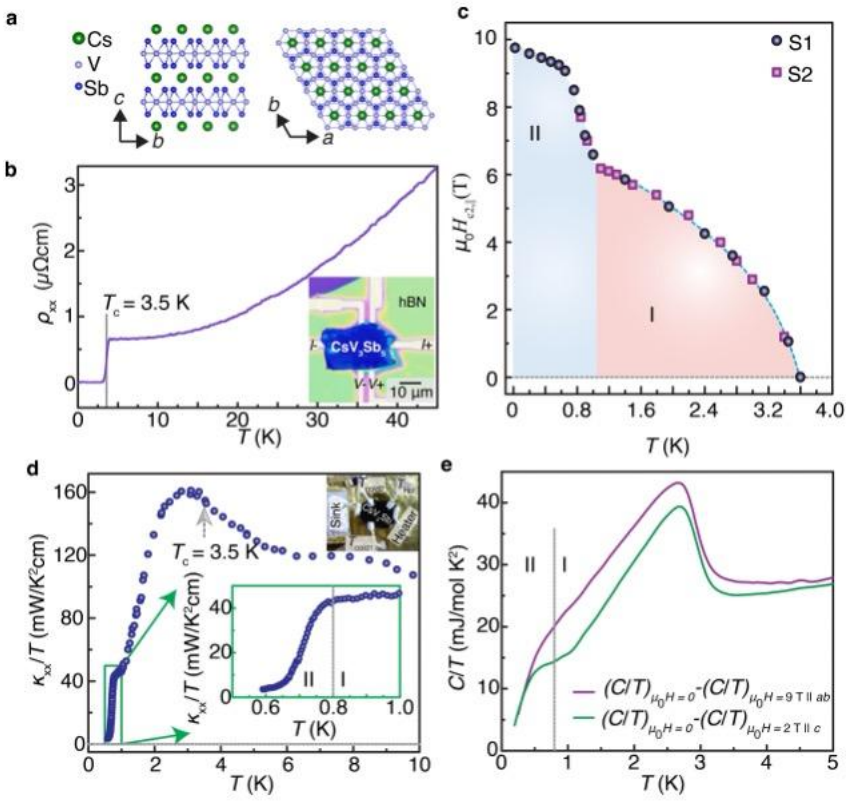

Figure 2.3.4 ***a****, Lattice structure.* ***b****, Superconducting transition,* ***c, d, e****, Electrical transport, heat transport, and heat capacity evidence of two distinct superconducting regimes in* CsV_3Sb_5*, respectively.*

discovery challenges conventional multiband superconductivity theories, in which gaps on different Fermi surface sheets are expected to be coupled through interband scattering. The result points to an unusually weak interband pairing interaction in CsV3Sb5, likely arising from the symmetry-breaking effects of the charge-ordered state, and opens new directions for understanding unconventional pairing mechanisms in kagome metals (**Figure 2.3.4**).

Quantum oscillations in the heat capacity of Kondo insulator YbB12

Kondo insulators are materials in which strong electron correlations open an energy gap at the Fermi level, producing an electrically insulating ground state. Despite this, several Kondo insulators exhibit quantum oscillations in thermodynamic and transport quantities that are conventionally associated only with metals possessing a well-defined Fermi surface. Whether these oscillations originate from surface states or from the bulk has remained a central question. Using the high-resolution nanocalorimetry technique developed at the DC Field Facility, the research team measured the heat capacity of YbB12 in continuous magnetic fields up to 41.5 T in the 35T and 41.5T resistive magnets. They observed oscillations at a frequency of 670 T, in agreement with magnetoresistance and torque magnetometry measurements. The oscillation amplitudes are substantial, with a magnitude of approximately 0.5 mJ/mol K2 at 0.8 K, accounting for 13% of the known electronic heat capacity coefficient. By analyzing distinctive double-peak structures in the temperature dependence of the oscillation amplitudes, the team determined an effective mass that agrees with independent torque measurements. Because the heat capacity is a bulk thermodynamic quantity, these results provide direct evidence that the oscillations originate from the bulk rather than from surface states as previously conjectured. The findings support the interpretation that electrically neutral fermions participate in the quantum oscillation phenomena, revealing a hidden quantum structure within this electrical insulator that challenges conventional understanding of the distinction between metals and insulators (**Figure 2.3.5**).

Citation: Chen, K.-W. et al. Quantum Oscillations in the Heat Capacity of Kondo Insulator YbB12. Phys. Rev. Lett. 135, 156501 (2025). https://doi.org/10.1103/PhysRevLett.135.156501

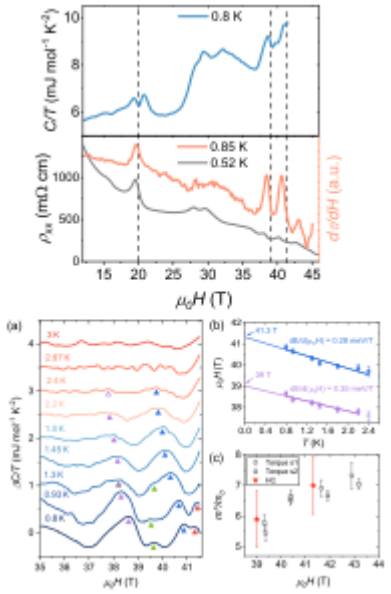

Figure 2.3.5 *Quantum oscillations in the Kondo insulator YbB12. Top: Heat capacity C/T (blue) and electrical resistivity rho_xx and derivative of the torque τ vs B (red, grey) as a function of magnetic field at sub-kelvin temperatures, measured in the 41.5T resistive and 45T hybrid magnets. Dashed lines indicate quantum oscillation maxima visible in all three quantities. Bottom: (a) Oscillatory component of C/T at temperatures from 0.8K to 3K, revealing a distinctive double-peak structure. (b) Landau fan diagram confirming oscillation frequencies of 41.1T and 36T. (c) Effective mass determined from the temperature dependence of the oscillation amplitudes in heat capacity (red) and torque magnetometry (blue and purple), yielding consistent values of approximately 5-7 free electron masses. The observation of quantum oscillations in the heat capacity -- a bulk thermodynamic quantity -- provides direct evidence that neutral fermions in the bulk, rather than surface states, are responsible for the metallic-like quantum oscillatory behavior in this electrical insulator.*

MAINTAINING FACILITY AND DEVELOPMENT OF NEW MAGNET SYSTEM INCLUDING OPERATION SCHEDULE AND SHUTDOWNS

Facility Plans and Directions

Development of Infrastructure Projects to Increase System Capabilities and Reliability

In 2025, the DC Field Facility finalized project plans for several critical infrastructure initiatives that will be executed in the coming years. These plans include the replacement of the Cooling Towers (scheduled for 2026) in support of the water-cooled magnet operations, the replacement of the on-site electrical substation (2026/2027) to enhance electrical reliability for high-power magnet operations and the installation of power quality conditioning equipment (2026/2027). Further, recovery strategies for the Series Connected Hybrid (SCH) and 32T magnets were developed to restore unique high-field capabilities and enhance operational support of these one-of-a-kind magnet systems. Plans were developed for the refurbishment of the 3 million gallons chilled water storage tank (2026). Together, these forward-looking projects position the MagLab for continued leadership in high-field research and ensure readiness for future operational demands.

Facility Condition Assessment of the DC Field Facility & Asset Management Plan

In 2023, the MagLab partnered with the Aerospace Corporation to develop a detailed facility condition assessment (FCA) of the MagLab user facilities, and this report was delivered to the MagLab and the NSF in March 2024. The report made several recommendations that were categorized according to risk priority, consequence, the likelihood of occurrence, etc. Using the FCA as the foundation, we have developed the first version of a formal asset management plan (AMP) which takes the findings & information from the FCA to build replacement schedules for critical equipment as well as mitigation plans to reduce risk to the facility during equipment lifecycles. Much of this work had already been done but it lacked the formalism necessary for the NSF to develop long-term projections of funding needs beyond standard operations and maintenance of the DCFF. The AMPis continually developed and refined so that it can grow and serve as an effective tool for the MagLab and the NSF.

Facility Operation Schedule

At the heart of the DC Field Facility are the four 14MW, low-noise, DC power supplies. Each 20MW or 28MW resistive magnet requires two power supplies to run, the 45T hybrid and the 41.5T resistive magnets each require three power supplies and the 36T Series Connected Hybrid requires one power supply. Thus, the DC Field Facility operates in the following manner: in a given week there can be four resistive magnets + seven superconducting magnets operating or the 45T hybrid/41.5T resistive, series connected hybrid, two resistive magnets and seven superconducting magnets. The water-cooled DC resistive and hybrid magnets operated for 38 weeks in 2025. Instrument and facility development work was conducted for 1 week at the beginning of January (returning the facility back to service from the annual maintenance shutdown at the end of 2024), 1 week mid-March and 2 weeks at the end of June/beginning of July, respectively. There also was a 5-week shutdown in September that was utilized for the installation of two resistive magnet protection systems (Cells 5 and 6), routine preventive maintenance and the training of operations personnel. The shutdown was scheduled during the peak of hurricane (to prevent facility downtime due to weather events) and football season (to circumvent high hotel pricing) per the user communities request. There was a second 5-week regular maintenance shutdown (during which an additional two magnet protections systems were installed in Cells 7 and 15) from Thanksgiving Week, November 24, into the New Year, including a two-week shutdown period for the university-mandated holiday break from December 22, 2025, to January 4, 2026. No magnet operations were lost due to storms or other natural disasters. The seven superconducting magnets operated for 49 weeks out of the year with staggered maintenance periods as required. The daily operation schedule for the resistive and hybrid magnets is as follows: 7 hours/day on Monday and 21 hours/day Tuesday-Friday. The superconducting magnets operate 24 hours/day, 7 days/week.

CONDUCTING EDUCATION AND OUTREACH ACTIVITIES

The DC Field Facility operated in a mostly normal manner in 2025 as evidenced by the number of users who came to the facility for magnet time. We hosted a booth at the 2025 Anaheim March Meeting trade show where we introduced the MagLab to potential new users as well as communicated with a large number of current MagLab users.

Appendix A shows that the DC Field Facility attracted 29 new PIs in 2025. This is in addition to the 27 new PIs reported last year (2024) and 35 reported in 2023.

The Annual DC Field Facility MagLab User Summer School was scheduled for the week of May 12, 2025. We hosted 17 participants for this immersive program designed to train the next generation of scientists in high magnetic field research. Each year, graduate students and advanced undergraduates from around the world participate in lectures, hands-on experiments, and collaborative projects led by MagLab experts. The program provides a unique opportunity to learn cutting-edge techniques, engage with leading researchers.

2.3 EMR FACILITY

Electron Magnetic Resonance (EMR) covers a variety of magnetic resonance techniques associated with the electron. The most widely employed is Electron Paramagnetic/Spin Resonance (EPR/ESR), which can be performed on anything that contains unpaired electron spins. EPR/ESR has thus proven to be an indispensable tool in a large range of applications in physics, materials science, chemistry, and biology, including studies of impurity states, molecular clusters, and molecular magnets; antiferromagnetic/ ferromagnetic compounds in bulk, as well as thin films and nanoparticles; natural or induced radicals, optically excited paramagnetic states, electron spin-based quantum information devices; transition-metal based catalysts; and structural and dynamical studies of metalloproteins, spin-labeled proteins, and other complex bio-molecules and their synthetic models.

OPERATION OF A WORLD-LEADING HIGH-MAGNETIC-FIELD USER PROGRAM

Unique Aspects of Instrumentation Capability

The EMR facility at the NHMFL offers users several home-built, high-field, and multi-high-frequency instruments covering the continuous frequency range from 9GHz to > 1THz. Several transmission probes are available for continuous-wave (CW) measurements, which are compatible with a range of magnets at the Lab, including the highest field 45T hybrid. Some of the probes can be configured with resonant cavities, providing enhanced sensitivity as well as options for *in situ* rotation of single-crystal samples in the magnetic field. Quasi-optical (QO) reflection spectrometers are available in combination with high-resolution 12.5T and 16T superconducting magnet systems; a simple QO spectrometer has also been developed for use in the resistive and hybrid magnets (up to 45T). EMR staff members can assist users in the DC field facility using broadband tunable homodyne and heterodyne spectrometers as well. Moreover, frequency coverage up to ~180THz (6,000cm 1) is now possible through collaboration with staff in the DC field facility using broadband Fourier transform infrared spectrometers to acquire EPR spectra in the frequency domain – so-called far-infrared magneto-spectroscopy (FIRMS). Finally, operation in the high-resolution 36T Series Connected Hybrid (SCH) magnet is another recent addition to the EMR user program.

In addition to CW capabilities, the MagLab EMR group boasts the highest frequency pulsed EPR spectrometer in the world, operating at 120, 240, 336GHz, and now 316 and 395GHz with ~100ns time resolution. A high-power (1kW) quasi-optical 94GHz spectrometer (HiPER) with 1ns time resolution (1GHz instantaneous bandwidth) is also available. Meanwhile, a state-of-the-art Bruker Elexsys 680 operating at the X- (9.7GHz) and Q- (34GHz) bands with ENDOR and optical excitation capabilities has been delivered to the EMR facility at the end of 2024. This unique combination of CW and pulsed instruments may be used for a wide range of advanced EPR applications, as well as a number of other spectroscopies, including optical conductivity, electron cyclotron resonance and Dynamic Nuclear Polarization (DNP).

Finally, the EMR group collaborates with the NMR program in developing instrumentation for high-field DNP-enhanced NMR studies of solids and solution samples at fields up to 14.1T. The centerpiece of this installation is a quasioptical EPR spectrometer based on a 395GHz high-power CW gyrotron source.

Major Research Activities and Discoveries

During the past year, EMR users reported **28** peer-reviewed journal articles, along with **two** Ph.D. dissertations and **one** Master's thesis. The overall quality of the publications remained high, with articles appearing in leading journals such as *Journal of the American Chemical Society* (6), *Chemical Science* (2), *Inorganic Chemistry* (3), and *Dalton Transactions* (5), as well as *Journal of Magnetic Resonance*, *Applied Magnetic Resonance*, and ACS journals (6). The total publication output (28) is consistent with recent years, matching 2024 and 2023 (28 each), and comparable to 2022 (25) and 2021 (27).

The EMR Program continued major efforts in support of major center-type research initiatives and international collaborations involving multiple universities. Ongoing funded collaborations included: the four-year, $12M DOE funded Energy Frontier Research Center for Molecular Magnetic Quantum Materials (M2QM) based at the University of Florida, with partners at the University of Central Florida, Florida State University, UTEP, Caltech and Los Alamos National Laboratory; a collaborative project together with researchers at Lawrence Berkeley National Lab and UC Berkeley, which focuses on "Molecular f-Element Qubits with Controllable Quantum Coherence and Entanglement"; and an international collaboration funded by the Office of Naval Research—Global, linking the MagLab with Osaka Metropolitan University in Japan and the University of Modena and Reggio Emilia in Italy. In addition, several major new initiatives were spearheaded, including: a $20M application to the NSF to establish a new Quantum Leap Challenge Institute (QLCI) – *Molecular Coherent Spin Platforms for Quantum Applications (MolSPIN)* – involving researchers at Florida State University, the University of Florida, Northeastern University, Yale University and The New Mexico Consortium; and an NSF Materials Research Science and Engineering Center with headquarters at FSU and partners at FAMU, the University of Florida, Stony Brook University, Colorado School of Mines, Emory University and Washington University – St. Louis. Of these two new applications, both were invited for full proposal submission, with the QLCI recently having undergone a reverse site visit.

We report three 2025 scientific highlights in the next section of this report. The highlighted work, published in Angewandte Chemie-International Edition and in the Journal of the American Chemical Society, involves users from the following institutions: The University of California at Berkeley; The US Navy; Philips Universität Marburg, Germany; Lawrence Livermore National Lab; The Technical University of Denmark, Denmark; The CSIC & Universidad de Zaragoza, Spain; The University of Copenhagen, Denmark; Universität Bielefeld, Germany; the University of Pennsylvania; the University of Texas at El Paso; the university of Oxford, UK; Universität Erlangen-Nuremberg, Germany; Indiana University, Roosevelt University; and Florida State University.

Unlocking Ultra-Cold Cooling: A Unique Magnetic Material for Next-Generation Refrigeration

Attaining sub-kelvin temperatures is technologically challenging and often relies on the scarce resource ^{3}He, unless employing adiabatic demagnetization refrigeration. Herein, the coolant typically consists of weakly coupled paramagnetic ions, whose magnetic interaction strengths are comparable in energy to the relevant temperature regime of cooling. Such interactions depend strongly on inter-ion distances, fundamentally hindering the realization of dense coolants for sub-kelvin refrigeration.

In this investigation, a magnetically concentrated triangular coordination network, $Eu_{0.9}Ba_{0.1}I_2(pyrazine)_3$, is reported featuring the large S = 7 /2 spin moment of Eu^{II} . High-field electron paramagnetic resonance (EPR), magnetization, and heat capacity measurements indicate weak antiferromagnetic correlations between the Eu^{II} spins and a dominant easy-plane magnetic anisotropy. In particular, EPR measurements at high magnetic fields and relatively high temperatures (80K – see **Figure 2.3.1**) are essential to quantifying the magnetic anisotropy independently from the inter-ion antiferromagnetic exchange interaction energy. This interdisciplinary collaboration has demonstrated a perfect combination of weak magnetic interactions and geometric frustration in the low-dimensional organic $Eu_{0.9}Ba_{0.1}I_2(pyrazine)_3$ framework, which prevents entropy-annihilating magnetic ordering down to at least 0.17K; large magnetic entropy is a critical requirement for adiabatic demagnetization refrigeration. These factors, combined with the large spin moment and high Eu^{II} concentration, open up exciting possibilities for efficient on-chip cryogenic refrigeration down to remarkably low (sub-kelvin) temperatures, especially in scenarios where established inorganic refrigerants cannot be utilized.

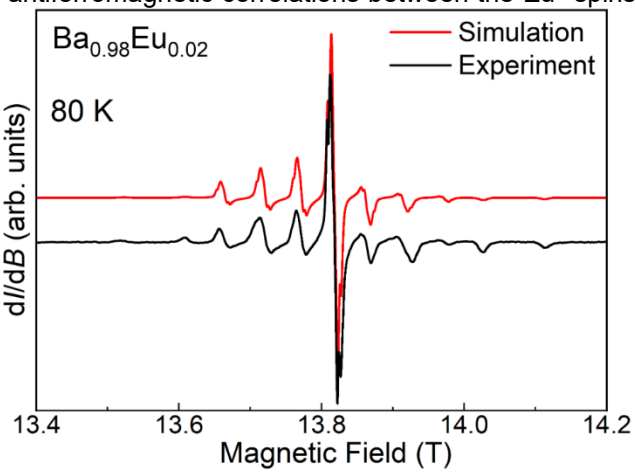

Figure 2.3.1 *High-field EPR spectrum (Experiment) of $Eu_{0.98}Ba_{0.02}I_2(pyrazine)_3$ recorded at a frequency of 385 GHz along with the corresponding simulation, from which quantitative information about the Eu^{II} magnetic anisotropy can be deduced.*

High-Field EPR Reveals Differences in Titanium-Based Catalysts' Electronic Structure

Titanium is an “Earth abundant” transition metal, unlike precious metals such as palladium (Pd) and platinum (Pt). Partly for this reason, titanium containingmolecules are widely used as catalysts for the production of polymers such as polyethylene, polycarbonates and other “plastics”. There is, however, always a need for improvement in these catalysts to make them more efficient, cheaper and safer. Oftentimes, the differences between a better functioning (i.e., higher activity) catalyst and a poorer (i.e., lower activity) one are related to very slight differences in the geometrical and electronic structure of the catalyst molecule.

Techniques such as X-ray crystallography can provide geometrical structures, while spectroscopic information is essential for gaining insights into the electronic structure and functionality of catalysts. One such technique is electron paramagnetic resonance (EPR), which can provide precise details about the role of unpaired electrons in chemical activity. However, the EPR spectra of many transition metals, e.g., titanium, often span a very wide magnetic field range (see **Figure 2.3.2**). This necessitates high-field measurements that can only be performed at the MagLab.

In this extensive investigation, a series of titanium-containing molecules was prepared by the group of Daniel Mindiola at U. Penn, a leading expert in this area. High-field EPR results from the MagLab show small but distinct differences among them which, when combined with electronic structure calculations, will guide further synthetic efforts aimed at making more catalytically useful molecules.

Chemical Control of Clock Frequency in a Series Molecular Lutetium(II) Qubits

Electron spin coherence can be significantly enhanced at so-called clock transitions – optimal operating points or avoided Zeeman level crossings at which the spin resonance frequency becomes insensitive to magnetic noise. Robust spin clock transitions can be generated by enhancing the electron-nuclear hyperfine interaction. In this regard, molecular lutetium 2+ complexes are attractive because they possess a lone unpaired electron that occupies a mixed 5d/6s orbital. Chemical tuning of this mixing to maximize the 6s character and, hence, the electron spin density at the nucleus, provides a way to optimize the electron-nuclear hyperfine coupling strength.

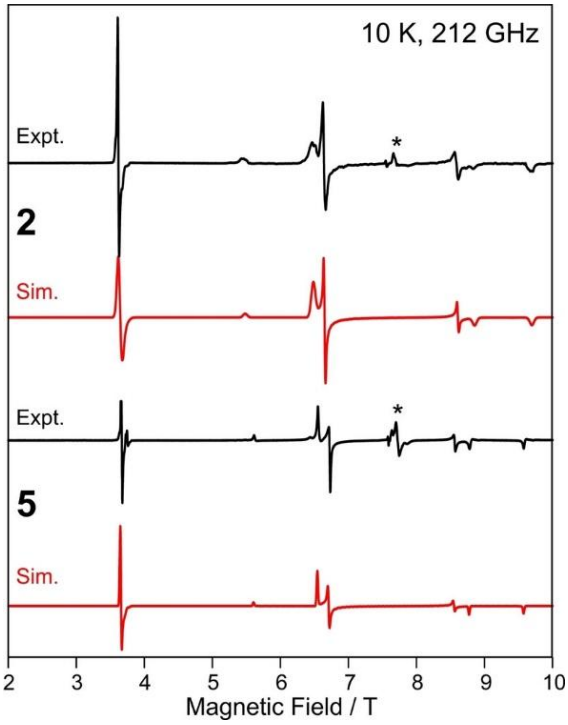

Figure 2.3.2 *HFEPR spectra of powdered samples of 2 (top) and 5 (bottom), recorded at 10K with microwave frequency 212.000GHz (black traces). Red traces are simulations for S=1 with parameters as in Table 2. The two features appearing at ~7.7T (asterisks) in each complex are due to a minute amount of Ti^{III} impurity (g~1.96) and an unidentified radical (g~2.00), not simulated.*

Chemists from the Naval Air Warfare Center and UC Berkeley synthesized a family of lutetium(II) sandwich-type molecules using pairs of planar cyclopentadienyl (Cp) ligands with varying substituents on the five-membered Cp rings. In this way, they have been able to control the linearity of the chemical coordination at the lutetium ion (angle θ – see **Figure 2.3.3**) which, in turn, regulates the degree of s-orbital character. In doing so, the strongest hyperfine coupling has been achieved for any molecular lanthanide compound to date. Accurately measuring such a strong hyperfine interaction requires electron magnetic resonance measurements (EMR) to be in a high-field regime in which the Zeeman interaction dominates. Hence, measurements could only be performed using the unique spectrometers at the MagLab (see **Figure 2.3.3**).

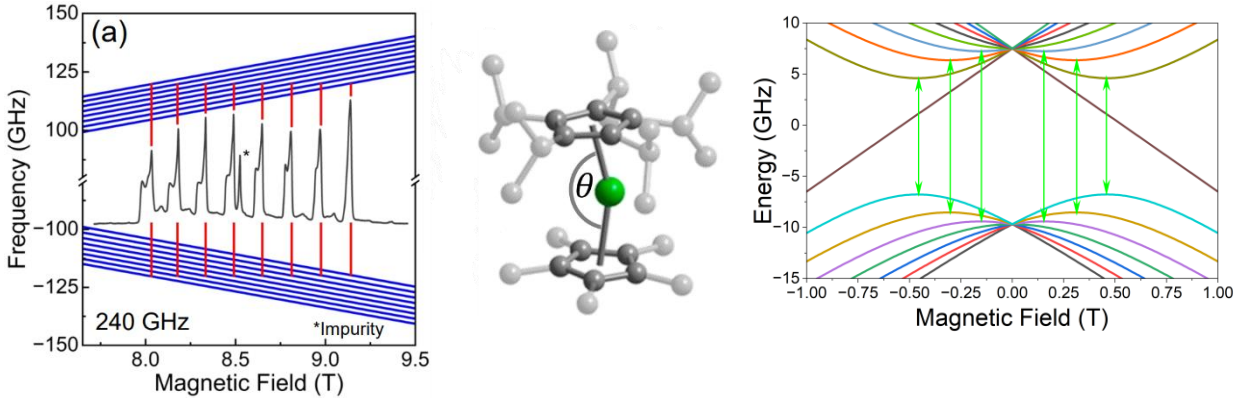

Figure 2.3.3 *(Left) High-field EPR spectrum of a powder sample overlayed on Zeeman level diagram depicting transitions between 8 hyperfine spin "up" and "down" sub-levels; fine structures are due to anisotropy in the powder.(Middle) One of the Lu(II) complexes. The angle θ correlates with the strength of the hyperfine coupling. (Right) Simulation of energy levels at low field for the S=1/2 I=7/2 Lu(II) system. The green arrows indicate positions of clock transitions.*

These results outline a general strategy toward the isolation of paramagnetic molecules with strong s-orbital electronic character, leading to a massive hyperfine interaction and a simple electronic ground state

with excellent coherence. Such molecules are of interest as spin qubits for next-generation quantum technologies.

CARRYING OUT IN-HOUSE RESEARCH AND SCIENTIFIC INSTRUMENTATION DEVELOPMENT IN SUPPORT OF THE USER PROGRAM

Facility Developments and Enhancements

The year 2025 saw significant instrument development for all of the user instruments in the EMR group. The most significant enhancements to the EMR program in early 2025 were the final acceptance of the installation of two new magnet systems to replace aging and failing magnet systems. These magnets had been delivered earlier in Dec 2023 and Feb 2024, but both systems had cryogenic problems requiring repair by Oxford Instruments, as detailed in last year's report. The first system is a 16T superconducting magnet replacing 15/17T magnet for the broadband transmission spectrometer. The previous magnet could no longer be run above 14.5T and quenched with increasing frequency. A fatal quench finally occurred in November 2024 while the new system was still in repair. After completion of the repair of a vacuum leak on the variable temperature insert, the new magnet system finally came online at the end of April 2025 and has so far performed without any major problems. The new system reaches a higher magnetic field and the absence of a superconducting switch allows a higher field sweep rate of 1T/min, which is double what was possible previously. This enables more efficient data collection without increased helium consumption. The new magnet is a cold-bore system with a Variable Temperature Insert (VTI) instead of the previous warm-bore magnet with a separate Variable Temperature (flow) Cryostat. This enables a lower base temperature (2K) and reduced helium use when operating at low temperatures.

The second new superconducting magnet system replaced the ageing and failing 9 Tesla magnet on the high-power pulsed EPR 95GHz spectrometer, HiPER. The new magnet/cryostat system offers many advantages over the older magnet, in addition to overall operational reliability. In particular, the older magnet experienced several failures that compromised performance: the overall field was limited to 4.5T, well below the original rating of 8T, and the magnet sweep profile experienced very significant and unpredictable hysteresis, greatly complicating studies of narrow-line spin systems. In addition, the standalone variable helium flow cryostat associated with the older warm-bore magnet suffered significant stability issues, particularly at lower temperatures, with an ultimate base temperature of around 8K. Moreover, the cryostat suffered frequent ice blockages and problems with the thermometry, causing significant disruptions to user operations. The new flow cryostat shares the same helium bath as the magnet, offering greatly improved low-temperature stability down to ~2K. HIPER saw a range of other enhancements in 2025. First of all, the 1kW high power amplifier, an Extended Interaction Klystron was nearing end-of-life. The only company making these klystrons also announced that it was ending production of EIKs sometime in 2024. The MagLab leadership recognized that this situation could mean the loss of one of the EMRs flagship spectrometers and found the funding to buy one of the last 95GHz EIKs. The new EIK arrived in 2025 and has been successfully installed in the spectrometer. Also in 2025, via a User Collaboration Grants Program (UCGP) grant obtained by Dubroca and van Tol in 2023, two more significant enhancements were made. Firstly, a 10W solid state amplifier was acquired with 100% duty cycle. While this results in longer excitation pulses and a loss of sensitivity and time resolution in comparison to the EIK, this enables to avoid the limited duty cycle of the EIK. This enables significantly longer pulses and pulse sequences, which is important for some types of experiments, and e.g. provides a better hyperfine resolution in echo-detected NMR experiments. Also a laser-excited optical switch was installed, serving as a high power switch directly after the last pulse from the EIK. This significantly reduces the trailing power from the EIK after it is switched off and decreases the deadtime from about 100ns to a few ns.

Also in 2025, the commercial state-of-the-art Bruker X-/Q-band (9/34GHz) pulsed EPR spectrometer with many advanced features such as in situ optical and nuclear excitation for double resonance investigations came online. While delivered at the end of 2024, the full installation has not been completed yet as various aspects of the spectrometer had technical problems and needed repair by Bruker. In the course of 2025 more features were operational, and the user training by Bruker and the final acceptance of the installation is now scheduled for April 2026. While some user experiments were performed in 2025, it will be fully available for outside users in the EMR user program starting in 2026. This Bruker spectrometer was funded through a completely separate NSF Major Research Instrumentation award (CHE-2320338) with Steve Hill as PI. New capabilities will be pulsed EPR/ENDOR at Q-band, arbitrary pulse shaping with the AWG, and the possibility of optical excitation enabled by an accompanying OPO-laser.

In addition to the aforementioned major facility enhancements, Tomas Orlando also received support through the MagLab UCGP and a Florida State University internal funding program to undertake critical enhancements/upgrades to the 12.5T pulsed heterodyne spectrometer. These plans include integrating an

Arbitrary Waveform Generator (AWG) capability and installation of a new multiplier chain providing 300mW of pulsed power at 263GHz, an order of magnitude increase in power relative to the current 240GHz chain. Not only does this provide a new frequency in the pulsed arsenal of the EMR facility, but it will also give rise to a factor of ~3 improvement in time resolution, as well as enhancements in sensitivity. The system operates by upconverting a frequency around 130GHz with the signal from the AWG and amplifying the frequency ~131.5GHz and doubling that to 263GHz. This enables full pulse control over a 4GHz bandwidth. The system was tested in 2025 without full AWG capabilities and performs well. In 2026, the final installation of Specman EPR software will be completed and this new capability will become available to external users. The Specman software is also used on HIPER and will enable a more uniform software environment across the spectrometers in the EMR program.

The Florida State University Quantum Science and Engineering (QSE) initiative (https://quantum.fsu.edu) provided support for the hiring of a postdoc, Sabastian Atwood, who received his PhD in the group of EMR user Christoph Boehm at the University of Utah. Together with EMR Director Hill, Sabastian has obtained additional support from the QSE initiative to develop a tunable (2-18GHz) pulsed EPR spectrometer based on a qubit controller purchased from the company QBlox Quantum. Work has been ongoing in 2025, and the first experiments in the magnet are planned for spring 2026.

MAINTAINING FACILITY AND DEVELOPMENT OF NEW MAGNET SYSTEM INCLUDING OPERATION SCHEDULE AND SHUTDOWNS

Facility Plans and Directions

The main new facility plans/directions center around the major new infrastructure that was installed in 2025. With the two new magnets now installed and operating well, we will now have new capabilities and improve overall operational reliability on two workhorse spectrometers (HiPER and Broadband Homodyne Transmission). This will allow us to allocate more time for external users in comparison to 2025 where the downtime, installation, and testing took a non-negligible part of the instrument time. The enhancements with the 10W cw amplifier will allow for longer pulse sequences and higher resolution of selected application, while the optical switch will allow the study of fast relaxing systems.

The new commercial Bruker E680 spectrometer operating at X- (9GHz) and Q- (34GHz) band will allow significant new capabilities. This spectrometer is already in use by outside users that were involved in the MRI grant application. Full capabilities become available for users in 2026 for pulsed EPR applications. In order to use the limited available instrument time efficiently, it will not become available for more routine cw-EPR applications. A completely new capability is for EPR of optically excited systems. A standalone tunable laser system was included with the Bruker spectrometer acquisition: 410 – 2500nm, 40mJ at 10Hz repetition rate. This optical excitation capability is also compatible with many of the high-field instruments within the EMR program, thus opening a completely new experimental dimension to our users, for photophysical, photochemical, energy, and quantum science applications. The EMR Users Sub-Committee has been asking for such a capability for many years. The laser system is now operational, and we are starting to see users take advantage of this highly sought-after capability. The Bruker spectrometer also adds another quasi-high-frequency pulsed capability at 34GHz to the EMR arsenal, for which there is clear demand for many key applications of interest to our users. Meanwhile, the upgrade converts the spectrometer to a modern digital console, including integration of a SpinJet Arbitrary Waveform Generator. As well as the addition of the Q-band capability, the new system will include pulsed ENDOR and high-power amplifiers at X- (600W solid state), Q-band (TWT 300W), and for ENDOR (500W) – all new capabilities.

As mentioned elsewhere in this report, upgrades to the 12.5T heterodyne pulsed EPR spectrometer will provide a new operating frequency (257-264GHz), improved time resolution due to increased microwave power, and, most importantly, integrate a modern AWG-driven pulse shaping capability. The increased power and ability to precisely shape pulses will allow for wider excitation bandwidths without introducing artifacts that can be problematic with conventional on/off pulses. In turn, this gives rise to further enhancements in sensitivity, beyond those due simply to the increased operational field and microwave power. In addition, the AWG capability permits more advanced pump-probe experiments such as electron-electron double-resonance detected NMR.

Also mentioned previously in this report, a very wideband pulsed instrument is currently under development that leverages a single qubit controller acquired from the company QBlox Quantum (Delft, Netherlands). These devices are manufactured for use with real quantum computing devices, enabling programmable operation of quantum processors in the DC to 18.5GHz range. This development responds to a national need identified in a recent National Academies report (https://doi.org/10.17226/26850) – that of a widely tunable pulsed EPR spectrometer to characterize new quantum systems that operate optimally at frequencies not reachable with commercial spectrometers. We plan to integrate this new capability with an existing split-pair 7T superconducting magnet system. A future frequency doubling capability will further extend the wideband coverage of this instrument.

Finally, the EMR program continues to leverage the FSU-funded Quantum Science and Engineering (QSE) Initiative in various ways. A new broadband pulsed EPR spectrometer is close to completion. Based

on a commercial QBlox qubit controller funded by the initiative, it has been designed and assembled by QSE postdoc Sabastian Atwood. In addition, a new QSE hire in chemistry has been integrated into the EMR program and assisting in the integration of the new optical excitation capability into the various pulsed EPR spectrometers within the EMR program.

Facility Operation Schedule

With the exception of the commercial Bruker spectrometer (see below) and the Transmission Spectrometer, overall user operations in the EMR program maintained pre-pandemic levels in 2025, i.e., the numbers of users, PIs, and proposals were all comparable to rates in 2018 and 2019. The workhorse Transmission Spectrometer operated for a total of **174** days during 2025, significantly down from 2024 (265 days). This is due to the significant downtime due to the fatal magnet quench while the new magnet was still in repair. This system became available only at the end of April 2025. Taking this into account, the use for the rest of the year was slightly up from 2024.

The 12.5T heterodyne quasi-optical spectrometer logged **151** days of usage, slightly down from **165** days in 2024. This instrument requires more intensive staff support, which is the reason the numbers are consistently lower than the broadband Transmission system, which can be operated by local students and users without supervision. Meanwhile, a total of **290** days were logged in 2025 on the high-power pulsed 94GHz EPR spectrometer, HiPER, significantly more than the **223** days 2024. These numbers do include about **100** days of maintenance, repair, and testing of the significant new capabilities, which is more than the 40 days or so for a typical year. We expect to be back to these **40** days of maintenance in 2026, which leaves more available days for external users.

While the new Bruker 680 commercial X- and Q-band was only available with reduced capabilities, it still logged **151** days of use in 2025. This is significantly more than the **98** days that were recorded in 2024. The low number in 2024 was due mostly to pulse capabilities of the old spectrometer having failed and only continuous wave operation was possible. With the completion of the installation of the new instrument in April 2026, we expect a high community interest and expect to user days to go up significantly.

As a whole, the four main instruments offered by the EMR User Program were oversubscribed by **186%** in 2025, i.e., **1,423** days were requested, and **766** total days allocated. Note that in spite of the installation and testing of the new capabilities the **766** days is up slightly from **751** in 2024. The oversubscription rate is somewhat typical for recent years (**84% in 2022, 98% in 2024),** and we expect that the number of submitted experiments was somewhat reduced due to the downtime of some instruments. The oversubscription rate in terms of experiment submissions was **121%**. This is slightly more than typical **(114.5% in 2024)**, which reflects that some experiments had to be declined due to specific capabilities not being available. However, it still reflects that the facility aims to provide access to most users with approved proposals who apply for time. However, the number of magnet days that the facility is able to offer is limited by instrument and staff availability.

CONDUCTING EDUCATION AND OUTREACH ACTIVITIES

The total number of proposals that received magnet time during 2025 was **52,** which is slightly less than in previous years **(57 in 2024)**. The number of PIs receiving magnet time was **48 (also a bit lower than the 48 in 2024),** of which **7 PI**s were first-time users of the EMR facility. The number of new PIs is significantly lower than in previous years, which might reflect that some of the limited capabilities discouraged potential users to apply. Meanwhile, the EMR program assisted **155** individual researchers in 2025, down from **175** in 2025, and similar to pre-pandemic numbers. Of these, **33** were first-time users of the facility in 2025. Only **42** users were present on-site, well below the **88** who were on-site prior to the pandemic in 2019. This is the fourth year in a row where these numbers are down, reflecting a concerning trend in more users sending samples as opposed to traveling to Tallahassee to participate in on-site measurements; as a percentage, **55%** of users were on-site in 2019, compared to just **27% in 2025**. There are some additional mitigating circumstances that account for this low number. Chiefly among these were the changes in rules for badging on-site users and reliability issues associated with magnet switchovers in two of the workhorse spectrometers. The latter resulted in significant instrument downtime, limiting scheduling of on-site users. The EMR staff made up for this by running experiments for users sending samples at every opportunity when systems were operational. Obviously, this mode of operation is less efficient and places significant strain on the already stretched EMR Research Faculty and is unsustainable. It is anticipated that the instrument reliability issue will be resolved quickly in 2026.

Members of the group continued their efforts to advertise the facility and recruit new users at regional, national, and international conferences and workshops around the globe, though financial constraints limited conference participation. Stephen Hill and other group members gave invited presentations at conferences, both in the US and in Europe. The EMR group also had a strong presence at the Rocky Mountain Conference (RMC) on Magnetic Resonance, for which the Stephen Hill served as the Chair, and the Southeastern Magnetic Resonance Conference (SEMRC), co-organized by Tomas Orlando; Tomas Orlando also in a member of the organizing committee of the IVEM seminars, which are well-attended

online seminars in collaboration with the International EPR Society. All, these events are frequented by existing users, providing excellent opportunities to showcase their outstanding work and to recruit new users.

Stephen Hill served on the organizing committees for the following events in 2025: The Rocky Mountain Conference EPR Symposium (Chair), which was held in August in Snowbird, UT; the 4th Magnetism in North America (MAGNA) Conference held at Florida State University (co-organizer); invited Symposium at the APS Global Physics Summit(organizer), a two-day Symposium at Pacifichem, Honolulu (co-organizer), and was on the Advisory Board of the Conference on Molecular Spin Qubits toward Quantum Computer and Sensor (ICMSQ 2025), in Sendai, Japan; the International Conference on Molecule-Based Magnets (ICMM), October, Bordeaux, France, and the Quantum Science and Engineering Symposium in Tallahassee. Furthermore, Stephen Hill was invited to two schools focusing on Electron Paramagnetic Resonance Spectroscopy in India in January/February. The first was a three-day school at IIT Bombay, with just six lecturers (from US, Italy and UK), and was attended by about 80 undergraduate students from across the country. The second was a half-day Symposium at IISER Thiruvananthapuram, where Stephen gave two tutorials.

EMR staff also supervised undergraduate internships during the spring and fall semesters and were mentors in the Research Experience for Undergraduates program during the summer semester.

Lastly, Stephen Hill wrote a popular article entitled “Making Qubits from Magnetic Molecules”, which appeared in the American Physical Society monthly magazine Physics Today in March 2025: https://pubs.aip.org/physicstoday/online/43992.

2.5 HIGH B/T FACILITY

OPERATION OF A WORLD-LEADING HIGH-MAGNETIC-FIELD USER PROGRAM

Unique Aspects of Instrumentation Capability

The High B/T Facility, located on the University of Florida campus, offers users a safe and welcoming atmosphere for performing research in high magnetic fields (up to 16T) and at ultralow temperatures (down to 0.5mK) with an ultra-quiet electromagnetic interference (EMI) environment. The Microkelvin Laboratory, the core of the High B/T Facility, is a separate, specially designed and built building with Tempest-quality shielded rooms to specifically afford access to the extremes of ultralow temperatures and high magnetic fields. Two demagnetization cryostats, one employing a PrN_5 + Cu refrigeration stage, known as Bay 3, the other equipped with a pure Cu stage, known as Bay 2, provide access to the ultralow temperature environments by using high magnetic fields of 8T to adiabatically cool the experimental regions. In other words, the high magnetic fields provide the means of refrigeration for cooling quantum materials in a steady high magnetic field applied to the sample region. In 2025, a Bluefors automated "dry" dilution refrigeration system, located in Bay 1, entered its second year of operating at temperatures below 10mK for user science with sample magnetic fields of 14T provided by a superconducting magnet. The introduction of a "dry" system to the inventory of unique instruments is a step in providing users with sustainable access to extreme environments needed to probe quantum materials while also equipping junior researchers with technical skills that are important for workforces in Florida and the nation. The combination of high magnetic fields with samples cooled to ultralow temperatures in an electromagnetically quiet environment provides users with access to parameter space that they cannot achieve in their home institutions or at other MagLab facilities. Briefly stated, the High B/T Facility provides users with opportunities to explore quantum matter, devices, and phenomena with unique, specialized probes, cells, and cryostats made in-house by staff in our facility and in our cryogenics, instrument design-fabrication, and electronics shops. The resulting enhanced understanding of quantum materials will guide the development of devices operating near ambient conditions.

CARRYING OUT IN-HOUSE RESEARCH AND SCIENTIFIC INSTRUMENTATION DEVELOPMENT IN SUPPORT OF THE USER PROGRAM

Facility Developments and Enhancements

An important aspect of the HBT cryogenic instruments is the use of experimental cells that employ pure ^{3}He immersion of the sample and the leads attached to the experimental platform. This approach and the presence of steel shielded rooms facilitate our ability to achieve electron temperatures in quantum materials and devices that are dramatically lower than can be achieved elsewhere. As mentioned in the preceding subsection, a Bluefors automated "dry" dilution refrigeration system with a 14T superconducting magnet entered its second year of operation for user experiments, and to meet the increased user demand for electron temperatures to the lowest temperatures, Assistant Scientist Rasul Gazizulin led an initiative to bring adiabatic demagnetization to the Bay 1 instrument. This work, funded by an award provided by the MagLab User Collaboration Grants Program (UCGP) which also funded the work of Alex Donald, a graduate student in Physics, added a special copper powder demagnetization refrigerant to the immersion cell design, **Figure 2.5.1**. Liquid ^{3}He was successfully cooled to below 2mK using this new cell, which will perform user work in 2026.

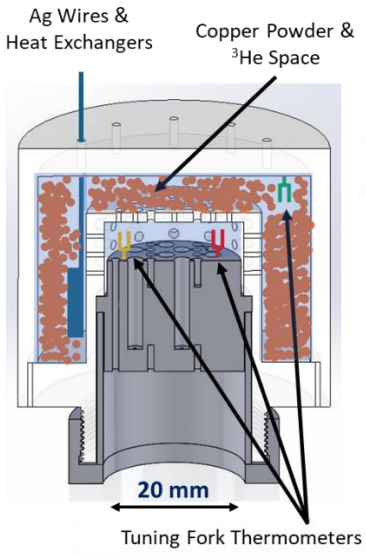

Figure 2.5.1. The use of sintered silver heat exchangers (central part of image) and copper powder (sketched as brown dots) immersed in pure ^{3}He enables effective electron thermalization while minimizing eddy current heating, thereby providing access to T > 2mK.

In 2025, the uninterruptible and clean power infrastructure remained in an inoperative state, which has been in this condition since 2020. This critical infrastructure, which is crucial for realizing the MagLab HBT mission, was externally reviewed by a team commissioned by the NSF. The Facilities Condition Assessment (FCA) report listed the absence of the HBT clean-uninterruptible power as one of five Priority One issues recommended for immediate attention. Using UF funds, the HBT leadership initiated a facilities upgrade request to the UF College of Liberal Arts and Sciences (CLAS) which, due to the expected costs, established a project with UF Planning, Design, and Construction (PDC) office. A UF PD (Project Director) was assigned, and Campbell Spellicy Engineering was contracted for the initial phase of this project in

October 2024. The estimates of the costs for the work were updated again a year later in 2025, but the sources of funding were still not identified. Ultimately, a modern system is needed to provide robust, uninterruptible, and clean power so routine electron temperatures below 10mK can be provided in the quantum materials being studied by users. Substantial progress toward identifying the funds for this project emerged in mid-December 2025, just prior to the Winter holidays of the academic calendar, so the resolution of this issue is expected in 2026.

Major Research Activities and Discoveries

Reciprocal and Nonreciprocal contributions to 1D Coulomb drag in the spin-polarized regime (Mingyang Zheng*, Rebika Makaju*†, Dominique Laroche, UF Physics; Alex Levchenko, UW Madison Physics; Sadhvikas J. Addamane, Sandia National Laboratories and Center for Integrated Nanotechnologies; Rasul Gazizulin, MagLab HBT and UF Physics; *graduate student, †PhD awarded Dec 2024) In a series of experiments using the new Bay 1 Instrument (see **Figure 2.5.2**), aspects of one-dimensional (1D) electron transconductance in quantum wire pairs were explored for electron temperatures evolving to below 7 mK and in the spin-polarized regime with magnetic fields up to 14T applied along the quantum wires. These results are directly related to MagLab UCGP (User Collaboration Grants Program) funding from the previous NSF award (DMR-1644779) that were acutely delayed by the COVID pandemic along with a cold-leak on the Bay 3 Instrument. The low electron temperatures were made possible using the pure ^{3}He immersion cell, and due to the low level of external electromagnetic interference (EMI) present in the HBT Facility. The identification of two distinct drag-inducing mechanisms within multi-channel quantum wires was made and reported in a first publication, and the evolution of these mechanisms in the magnetically-induced spin-polarized regime was studied. Notably, beyond a cross-over temperature, the drag signal temperature dependence is well described by a power-law whose scaling between the spinless and the spinfull regimes matches predictions for ballistic and reciprocal Coulomb drag despite being in the non-ballistic and nonreciprocal regime. These findings highlight the need for future work to understand nonreciprocal Coulomb drag in 1D systems. References: M. Zheng *et al.*, *Nat Commun* **16**, 6963 (2025). and M. Zheng et al., arXiv:2506.14967 (2025) (accepted to appear in *Phys. Rev. B* in 2026).

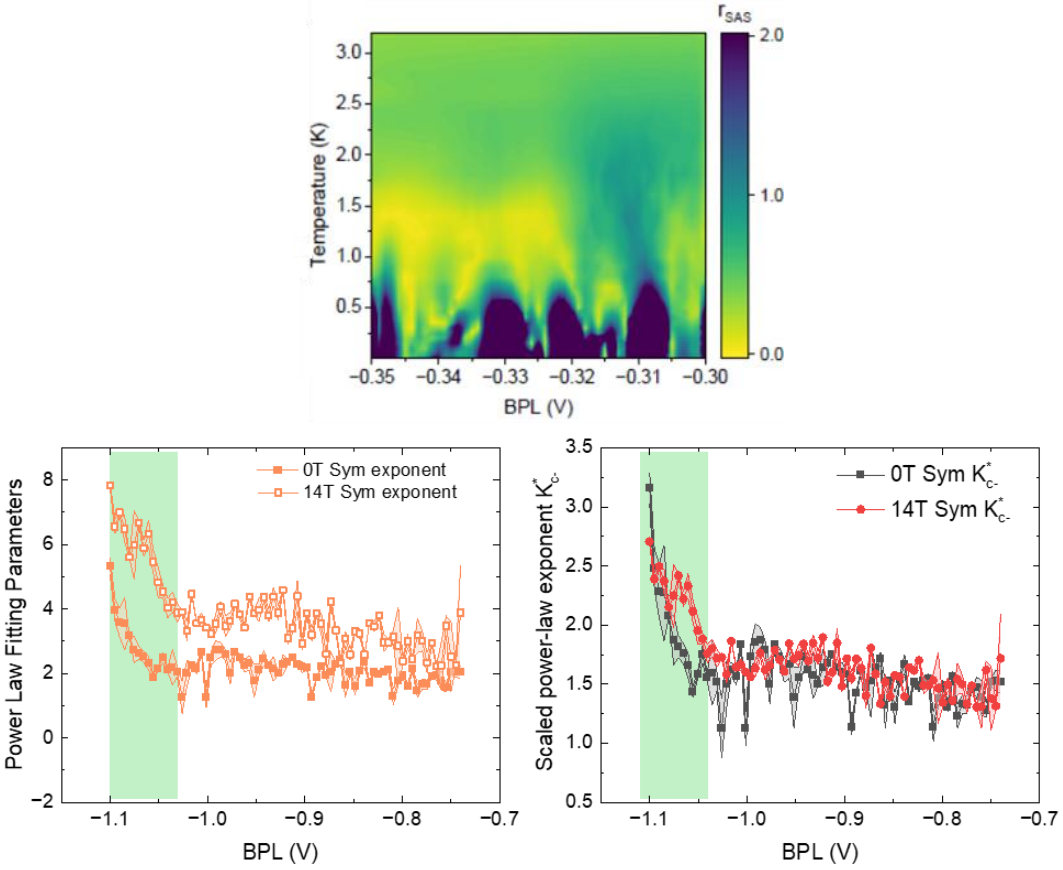

Figure 2.5.2. *(left) Ratio between reciprocal and nonreciprocal drag voltage as a function of gate voltage and temperatures down to T < 7 mK showing tunability with both parameters. M. Zheng et al., Nat Commun 16, 6963 (2025). (middle) Extracted power-law exponent of the Coulomb drag temperature dependence as a function of gate voltage both in the spin-full (0T) and in the spin-polarized (14T) regime.(right) Scaled power-law exponent at 0 and 14T, showing that the predicted scaling relations of Coulomb drag for ballistic reciprocal drag remain fulfilled in the non-ballistic and nonreciprocal regime. M. Zheng et al., arXiv:2506.14967 (2025),* (accepted to appear in *Phys. Rev. B* in 2026).

MAINTAINING FACILITY AND DEVELOPMENT OF NEW MAGNET SYSTEM INCLUDING OPERATION SCHEDULE AND SHUTDOWNS

Facility Plans and Access

Table 2.5.1 summarizes the present and future capabilities of the High B/T facilities at the University of Florida, which are described in this section. Proposals for magnet time may be submitted at any time, and contact/discussions with staff are recommended prior to submission. Users work with the faculty scientists to mount and tune the experiments on site. When the experiments begin, a member of the user team remains to assist the staff to perform the instant-to-instant steps, or in some instances, the users consult from off-site locations when the experiments span long periods of time due to the nature of significant relaxation times at the extremes of parameter space.

Table 2.5.1. *The instrumentation available in the MagLab High B/T Facility tabulated, and their unique combination of temperature, magnetic field, and techniques are highlighted. Specialty shielding and filtering of the equipment provides the ultraquiet electromagnetic interference environment.*

Equipment	Features	Supported Research
Bay 3: 16T superconducting magnet, 20mm dia. sample space	Temperatures ≥ 1mK, by 8T demag $PrNi_5$ + Cu stage.	Magnetization, quantum transport, torsional oscillator, viscosity, specific heat, dielectric, MEMS
Bay 2: 8T superconducting magnet, 32mm dia. sample space	Temperatures ≥ 0.5mK, by 8T demag Cu stage.	NMR, quantum transport, magnetization, heat capacity, pressure cell, thermal transport
Bay 1: 14T superconducting magnet, 32mm dia. sample space	Temperatures ≥ 7mk, demag cell to be deployed in 2026.	quantum transport, with rotation access planned, novel magnetometry, scanning probes
NPB B135 OBT: on-boading and testing facility, 28mm dia. sample space	NPB B135, ≥ 350mK with access to 9T possible for sample and cell tests before transfer to Bays 1-3.	Exploratory, novel technique development, sample/cell verification prior to use on Bays 1-3

Facility Operation Schedule

Bays 1 and 2 in the Microkelvin Facility are operational and open to new proposals from users, while a leak in the dilution unit of Bay 3 is being addressed. The High B/T Facility is operational year-round, including during the University of Florida holidays and campus closure during the final week of December. Experiments can continue overnight and through closures when direct supervision of the experiment is not required. Visiting scientists from outside of Florida typically find short-term housing via online agencies when hotel options become prohibitively expensive. There are several times a year when local housing rates are at maximum levels due to sporting events, graduation weekends, and other special events. Users are encouraged to contact staff to obtain advice on housing and visiting options.

CONDUCTING EDUCATION AND OUTREACH ACTIVITIES

The HBT team conducts impromptu tours of the facility throughout the year, often with little advance notice. When a tour is scheduled, the post-doctoral associate Nicolas Silva coordinates the event. Visitors receive a safety briefing before moving through the facility in small groups of fewer than eight people. They then engage in hands-on activities known as the rubber-band and magnetic-imaging “challenges.” In 2025, roughly 80 visitors toured the lab. Participants included a local Women in Science group, REU summer students, the Society of Asian Scientists and Engineers, several University of Florida students, and a physics class from Daytona State College. The HBT team also hosted a REU student, Nathan Good of Grinnell College. Encouraged by his enthusiasm, Nicolas joined the Department of Physics Broader Impacts (BIP) group. Through BIP, he presented a Zoom session to high-school students from Florida International University’s Center for Development, Support, and Success in Engineering and Computing (CDSSEC). The presentation covered engineering, undergraduate success, and career pathways. Annually, the University of Florida hosts a large outreach event, “STEM on the Lawn.” Many departments and student organizations set up demonstration tables. The MagLab HBT table showcased how to use magnets to sense what you cannot see, explained basic methods to reach microkelvin temperatures, and described the experiments probing quantum phenomena using the microkelvin laboratory. The event drew about 1,500 community members and families. Additional outreach activities are organized by Eli Wolf, the Research and Outreach Coordinator for the MagLab AMRIS and HBT facilities. Full details appear in the AMRIS Facility and Outreach section of this report.

2.6. ICR FACILITY

During 2025, the Fourier transform ion cyclotron resonance (ICR) mass spectrometry (MS) program continued to pursue instrumentation upgrades, automation, and novel applications of FT-ICR mass spectrometry. The associated methods were made available to external users through the NSF National High-Field FT-ICR Mass Spectrometry Facility. The Facility features ten staff scientists who support instrumentation, software, biological, petrochemical, and environmental applications, as well as a partial machinist, technician, and several rotating postdocs who are available to collaborate and/or assist with projects.

OPERATION OF A WORLD-LEADING HIGH-MAGNETIC-FIELD USER PROGRAM

The ICR Facility provides sample analysis that requires the ultrahigh resolution ($m/\Delta m_{50\%}$ > 1,000,000 at *m/z* 500, where $\Delta m_{50\%}$ is the full mass spectral peak width at half-maximum peak height) and sub-ppm mass accuracy only achievable by high-field FT-ICR MS. The facility's FT-ICR mass spectrometers feature high magnetic fields (as high as 21T) and are compatible with multiple ionization and fragmentation techniques as well as online separation techniques, including liquid chromatography**. In 2025, a new spectrometer was acquired that includes trapped ion mobility spectrometry (TIMS) for rapid gas-phase separation of, e.g., isomeric molecules with identical molecular weight.** This acquisition brought our number of FT-ICR mass spectrometers available to the user program to four **(Table 2.6.1)**.

Table 2.6.1. *ICR systems at the MagLab in Tallahassee*

Field (T), Bore (mm)	Homogeneity	Ionization Techniques
21, 123	<5ppm peak variation over a 60mm diameter by 100mm long cylinder	ESI, APPI, APCI, MALDI
14.5, 104	<5ppm peak variation over a 60mm diameter by 80mm long cylinder	ESI, APPI, APCI, MALDI
9.4, 220	<10ppm peak variation over a 60mm diameter by 100mm long cylinder	ESI, APPI, APCI
9.4, 155	<10ppm peak variation over a 60mm diameter by 80mm long cylinder	ESI, MALDI

Unique Aspects of Instrumentation Capability

21T hybrid quadrupole-linear ion trap-orbitrap-FT-ICR mass spectrometer. In 2015, the ICR facility commissioned the first 21T FT-ICR mass spectrometer. The 21T magnet is the highest field superconducting magnet ever used for FT-ICR and features high spatial homogeneity, high temporal stability, and negligible liquid helium consumption (**Figure 2.6.1**) (*J. Am. Soc. Mass Spectrom.,* **26**, 1626 (2015)). The original implementation (**Figure 2.6.1, Left**) coupled a commercial dual linear ion trap front end with the 21 T FT-ICR mass analyzer. This dual linear ion trap features high sensitivity, precise control of trapped ion number, proton transfer reaction (PTR), and collisional and electron transfer dissociation. A third linear quadrupole trap offers high ion capacity and ejection efficiency, as well as rf quadrupole ion injection optics for delivering ions to a dynamically harmonized ICR cell.

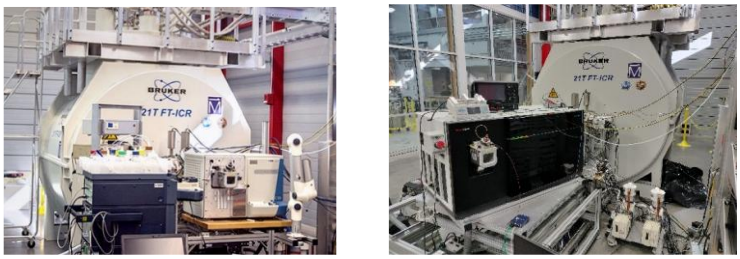

Figure 2.6.1. *The MagLab 21T FT-ICR mass spectrometer. Left: previous dual linear ion trap front end. Right: 2024 Eclipse tribrid front end upgrade.*

In 2024, the dual linear ion trap was replaced with an Eclipse tribrid commercial front end comprising a high transmission quadrupole mass filter, a dual linear ion trap, and an orbitrap mass analyzer (**Figure 2.6.1, Right**). This configuration represents the first quaternary hybrid mass spectrometer**.** This unique instrumentation provides improved sensitivity, precursor ion selection, and speed while offering unprecedented flexibility for tandem mass spectrometry experiments, enabling data acquisition within the FT-ICR, orbitrap, and linear RF ion trap simultaneously. Such parallelization improves duty cycle, an advantage of particular value in hyphenated liquid chromatography experiments.

Mass resolving power of 150,000 (m/Δm50%) is achieved for bovine serum albumin (66kDa) over a 0.38-second detection period (**Figure 2.6.2**), and greater than 2,000,000 resolving power is achieved for a 12-second detection period. Externally calibrated broadband mass measurement accuracy is typically less than 150ppb rms, with resolving power greater than 300,000 at m/z 400 for a 0.76-second detection period. Electron transfer dissociation results in 87% sequence coverage (94% if bonds with adjacent proline residues are ignored since they cannot be cleaved via ETD) for carbonic anhydrase (*J. Am. Soc. Mass Spectrom*. **28**, 1787 (2017)). The instrument is part of the NSF High-Field FT-ICR User Facility and is available free of charge to qualified users with optimized experimental conditions, including top-down proteomics (*Science*, **375**, 411 (2022)), ultrahigh-resolution ion isolation via SWIFT Fourier Transform mass spectrometry (*Anal. Chem.,* **92**, 3213 (2020)), single cell and subcellular MALDI imaging (*Anal. Chem.* **95**, 6089 (2023)), and natural organic mixture analysis (*Nat. Commun.,* **13,** 2153 (2022)).

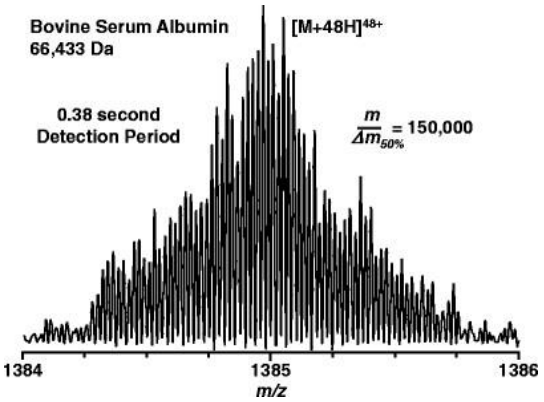

Figure 2.6.2. *Single-scan electrospray FT-ICR mass spectrum of the isolated 48+ charge state of bovine serum albumin following a 0.38s detection period. Mass resolving power is ~150,000 and the signal-to-noise ratio of the most abundant peak is >150:1. The ion accumulation period was 250ms and the ion target was 5,000,000.*

14.5T hybrid quadrupole-linear ion trap-orbitrap-FT-ICR mass spectrometer. An actively-shielded 14.5T, 104mm bore system offers ultrahigh mass measurement accuracy (<300 parts-per-billion rms error) and a combination of high scan rate and mass resolving power (resolving power >200,000 at m/z 400, at >one scan per second). In 2023, this instrument was also upgraded from a dual linear ion trap to an Eclipse Tribrid front end. The spectrometer features electrospray, atmospheric pressure photoionization (APPI), atmospheric pressure chemical ionization (APCI), and MALDI sources; linear quadrupole trap for external ion storage, PTR, collisional and electron transfer dissociation (CID/HCD+ETD); and automatic gain control (AGC) for accurate and precise control of charge delivered to the ICR cell. The combination of AGC and high magnetic field make sub-ppm mass accuracy routine without the need for an internal calibrant.

The 9.4T, passively-shielded, 220mm bore system offers a unique combination of mass resolving power (m/∆m = 8,000,000 at mass 9,000 Da) and dynamic range (>10,000:1), as well as high mass range, mass accuracy, dual-electrospray source for accurate internal mass calibration, efficient tandem mass spectrometry (as high as MS^8), and long ion storage period. A redesign of the custom-built mass spectrometer coupled to the 9.4T, 220 mm bore superconducting magnet designed around custom vacuum chambers has improved ion optical alignment, minimized distance from the external ion trap to the magnetic field center, and facilitated high conductance for effective differential pumping (*J. Am. Soc. Mass Spectrom*. **22**, 1343, (2011)). The length of the transfer optics is 30% shorter than the prior system, for reduced time-of-flight mass discrimination and increased ion transmission and trapping efficiency at the ICR cell (*J. Am. Soc. Mass Spectrom.* **25**, 943 (2014)). The ICR cell, electrical vacuum feed through, and cabling have been improved to reduce the detection circuit capacitance (and improve detection sensitivity) twofold (*Rev. Sci. Instrum.,* **85**, 066107 (2014)). The magnet is passively shielded to allow proper function of all equipment and safety for users. The system features external mass selection prior to ion injection for further increase in dynamic range and rapid (~100ms time scale) MS/MS (*Anal. Chem.*, **75**, 3256 (2003)), with ultrahigh-resolution ion isolation via stored waveform inverse Fourier transform (SWIFT) followed by infrared multiphoton dissociation (IRMPD).

The 9.4T, actively-shielded, 155mm bore system was previously fitted with a custom pulsed laser cluster source for nanocarbon and fullerene studies (*Nat. Commun*. **5**, 5844 (2014**)**. In 2025, a prototype gated TIMS-FT-ICR spectrometer (*Anal. Chem*., **96**, 11343 (2024)) was procured to couple with this magnet system. This instrument arrived at the very end of the year, with the first data collected during the week of December 8, 2025. The instrument includes front-end trapped ion mobility spectrometry for rapid gas-phase separation of molecules based on their shape. Collision-activated dissociation can be performed both externally and inside the ICR cell. In-cell fragmentation through ion-electron reactions is also supported. The dual ESI-MALDI source can be operated in imaging mode down to 3µm spatial resolution. Routine operation offers resolving power of >1,000,000 (>1,500,000 in 2-omega mode) at m/z 400 and fmol sensitivity. This instrument represents the first timsMRMS system in North America and will be released to users in 2026.

.

Major Research Activities and Discoveries by ICR Facility Users

Complex mixture direct infusion analysis benefits from the 21T FT-ICR system through high mass-resolving power, mass accuracy, and dynamic range, which enable resolution and confident elemental formula assignment for tens of thousands of unique species in complex organic mixtures (*Anal. Chem.,* **94***,* 11382-11389 (2022)). In 2025, this unique performance was leveraged to perform molecular composition analysis for a variety of highly complex samples from soils, lake sediment, river, ocean, and glacial waters, to tropical tree roots, and pyrolysis oils. Negative ion electrospray ionization (nESI) is particularly suitable for the analysis of acidic natural organic matter. Soil and sediment nESI data from the 21T FT-ICR instrument were used to gain insights into shifting organic matter pools with a warming planet, human activities such as land-applied biosolids from wastewater treatment, and during soil development in drylands (*J. Geophys. Res. Biogeosci*., **130**, e2025JG008899 (2025); *J. Geophys. Res. Biogeosci*., **130**, e2024JG008445 (2025); *Soil Environ. Health*, **3**, 100148 (2025); *Palaeogeogr. Palaeoclimatol. Palaeoecol*. **663**, 112798 (2025); *Environ. Res*., **287**, 123052 (2025); *Enivron. Sci. Technol*., **59**, 2665 (2025); *Geochim. Cosmochim. Acta*, **408**, 283 (2025)).

21T nESI data from solid phase extracted glacial water samples and surface ice revealed how anthropogenic carbon is deposited and exported from glaciers in the Arctic and Antarctic (*Global Biogeochem. Cycles*, **39**, e2024GB008359 (2025); *Biogeosci*., **22**, 41 (2025); *J. Geophys. Res. Biogeosci*., **130**, e2025JG008931 (2025); *Cryosphere*, **19**, 2769 (2025)). Data from extracted Amazon basin river samples over 8 years revealed seasonal changes in the delivery of dissolved organic matter to the ocean and an additional contribution of ~5 % (*Global Biogeochem. Cycles*, **39**, e2025GB008545 (2025)). Sinking particulate organic matter in the ocean was analyzed with the 21T instrument, revealing patterns of microbial organic matter transformation across regimes (distance from coastal regions) and depth that provided novel insights into global carbon sequestration (*Proc. Natl. Acad. Sci. U.S.A.*, **122**, e2504769122 (2025). Samples from the ocean surface microlayer were characterized by the 9.4 T passive system and showed dissolved organic carbon and photobleached material, including sulfur-containing compounds proposed to act as surfactants, lowering the surface tension at the air-sea interface (*Marine Chem*., **272**, 104547 (2025)).

The 21T ICR system was further employed to analyze root samples from wild vs. cultivated tropical trees, showing that, while the metabolomes differed, compounds of therapeutic interest were enriched under both conditions (*Phytochem. Anal*., **36**, 1829 (2025)). 21T positive and negative mode ESI were used to characterize and source trace nitrogenates and halogens in polyolefin waste pyrolysis oils, providing new fundamental insights into the formation, persistence, and possible origin of heteroatomic contaminants that hamper clean recycling of plastic waste (*Energy Fuels*, **39**, 22780 (2025)). Finally, a combination of ionization methods was employed for comprehensive analysis of burned soil organic matter, allowing detection of novel biomarkers for environmental monitoring and biogeochemical studies (*Anal. Chem*., **97**, 24040 (2025); **Figure 2.6.3**).

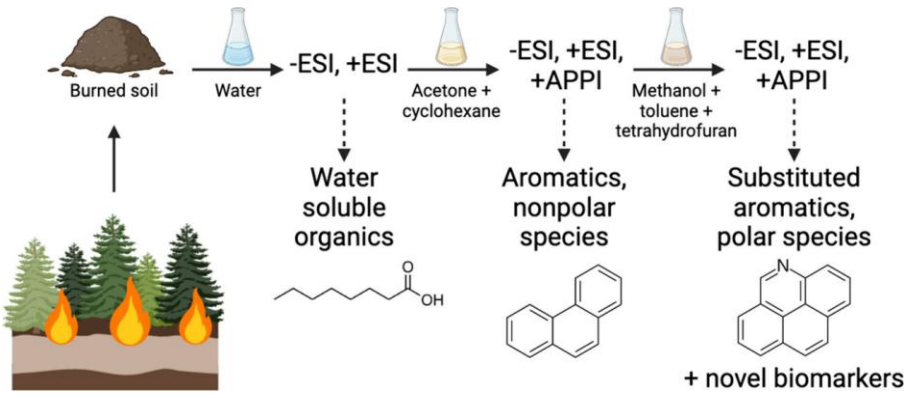

Figure 2.6.3. *Characterization of burned soil organic matter via sequential solvent extractions and 21T FT-ICR mass spectrometry with electrospray and atmospheric pressure photoionization.*

Online LC-FT-ICR MS. While direct infusion FT-ICR MS is highly powerful for molecular formula assignment in complex matrices, online liquid chromatography can resolve additional compounds and improve dynamic range. In 2025, online LC-FT-ICR MS at 21T was employed for detection and structural elucidation of copper binding ligands produced by a marine diatom (*J. Am. Soc. Mass Spectrom*., **36**, 713 (2025)). Such ligands are important for determining the reactivity and bioavailability of copper in the ocean. Copper- and iron-binding organic ligands were further identified via 21T LC-FT-ICR MS analysis of rare whale fecal samples (*Commun. Earth Environ*., **6**, 20 (2025)). Iron ligands had weak to intermediate binding strength (making iron bioavailable) whereas 47 novel copper-binding ligands showed strong binding, curtailing copper toxicity and illustrating an important ecosystem role of these whales.

Online 21T FT-ICR MS of wood pyrolysis biooils resulted in a doubling of the number of identified molecular compositions (*Energy Fuels*, **39**, 3575 (2025); **Figure 2.6.4**). This work also revealed isomeric diversity and promise to improve on other sample types, such as the environmental samples discussed above.

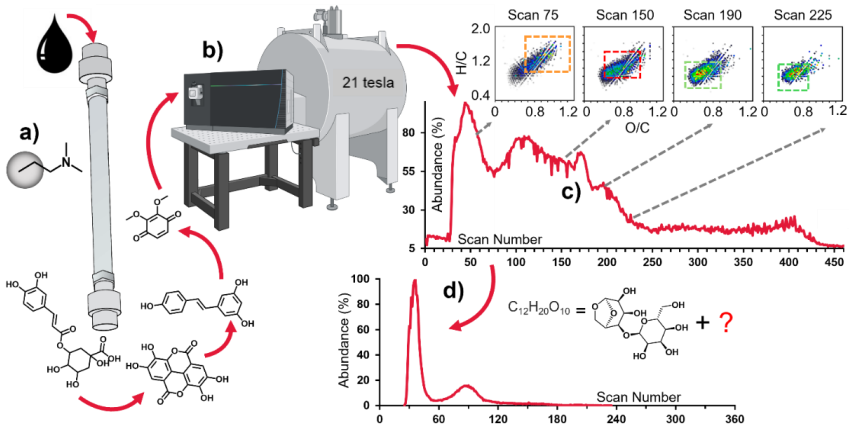

Figure 2.6.4. *(a) Dimethylaminopropyl stationary phase separates bio-oil components by acidt and polarity. Non-acidic species elute first; polyphenols, carboxylic acids, and polyfunctional compounds elute later. (b) Effluent is analyzed by 21T FT-ICR MS, acquiring one spectrum every ~5 seconds. (c) Total ion chromatogram with selected scans displayed as van Krevelen diagrams (H/C vs O/C), revealing compositional trends from carbohydrates to aromatic acids. (d) Single-ion chromatogram for $C_{12}H_{20}O_{10}$ shows two peaks, indicative of isomers. The first likely matches cellobiosan (structure shown); the second may include acidic groups. The number of unique formulas detected with this chromatographic approach is nearly twice that of direct infusion.*

Online nanoflow LC is key to proteomic analysis due to the typical limited sample quantities, need for desalting, and improved ionization efficiency from smaller electrospray droplets. In collaborative work with the NMR user program, nanoflow LC coupled with the 21T ICR was used to confirm the sequence of an antibody, whose properties at an oil-water interface were studied (*J. Pharmaceut. Sci.* **114**, 103685 (2025)). During development, antibodies are exposed to such interfaces, which can trigger unfolding and loss of function.

CARRYING OUT IN-HOUSE RESEARCH AND SCIENTIFIC INSTRUMENTATION DEVELOPMENT IN SUPPORT OF THE USER PROGRAM

In the area of **environmental and petrochemical applications**, in-house research by graduate student Frye-Jones showed that fractionation of photooxidation products from a heavy vacuum gas oil into water soluble, oil soluble, and interfacial material resulted in detection of novel compounds (*Energy Fuels*, **39**, 1031 (2025)). Photopolymerization products were detected in acidic fractions of high carbon number and aromaticity. Interfacially active material also revealed minor polymerization products. These methods will be shared with our users.

A major ICR user program effort in 2025 was implementation of an automated method for acquisition of direct infusion electrospray data. This method, termed DIADEM, has allowed thousands of spectra to be collected during 24-7 operation of the 21T ICR. Such automation is now being combined with automated data processing through the International – Complex Matrices Molecular Characterization (iC2MC) consortium of which the ICR Program is a member. A spectral averager was developed through the FSU-funded collaboration with the Department of Computer Science. Batch phasing of such data for improved resolution has also been realized and data processed in this manner have been released to users after vetting against conventional semi-manual processing. A key aspect of this data processing pipeline is the implementation of mass difference analysis, which allows complex mass spectra to be recalibrated without the use of internal calibrants (*Anal. Chem.* **97**,18543 (2025); **Figure 2.6.5)**.

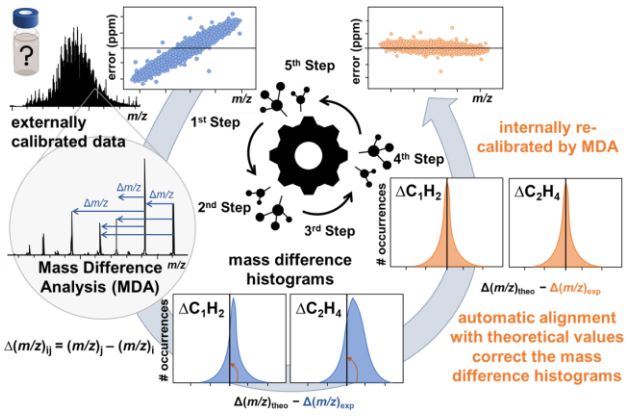

Figure 2.6.5. *Mass difference analysis using graph theory allows recalibration of complex mass spectra to within tens of ppb, thus greatly improving molecular formula assignment.*

The ICR Facility also continues to innovate in **instrumentation development** for FT-ICR mass spectrometry. In 2025, three-way parallelization of the linear ion trap, orbitrap, and ICR mass analyzers on the 14.5 and 21T instruments was demonstrated; a unique capability for structural determination.

MAINTAINING FACILITY AND DEVELOPMENT OF NEW MAGNET SYSTEMS, INCLUDING OPERATION SCHEDULE AND SHUTDOWNS

Facility Plans and Directions

The ICR facility will continue to expand its user facility using the world's first 21T FT-ICR mass spectrometer, including expansion of the MALDI imaging sampling and acquisition capabilities, and LC FT-ICR MS for complex mixtures. A new MALDI imaging source, compatible with the front-end upgrades to the 14.5T and 21T instruments, has been acquired. The new timsMRMS instrument, installed into the 9.4T actively-shielded, 155mm bore magnet, is also equipped for MALDI imaging. The new trapped ion mobility spectrometry (TIMS) capability allows rapid gas-phase separation of isomers for improved imaging and analysis of complex mixtures. Other plans include improved automation of dissolved organic matter direct infusion analysis, an approach that, along with automated AI-driven data analysis, will significantly increase sample throughput in our Facility.

Facility Operation Schedule

The ICR facility operates year-round, with weekend instrumentation time scheduled. Throughout 2025, we have continued the integration of the front-end upgrades from the Velos Pro linear ion traps to the Eclipse tribrid instrumentation. While user access has greatly increased compared with 2024, some capabilities, including detection of fragment ions in the ICR mass analyzer, remain to be fully available. Once this upgrade has been fully completed, the facility plans to grow our biological applications. The ICR facility operates with both on-site users and users sending samples for data acquisition by internal ICR support staff.

CONDUCTING EDUCATION AND OUTREACH ACTIVITIES

Outreach to Generate New Proposals – Progress on STEM and Building User Community

The ICR program provided magnet time to nine new principal investigators in 2025. ICR faculty participated in several conferences to increase the visibility of the User Facility, including the annual American Society for Mass Spectrometry conference (Baltimore, MD), the Breast - Gynecological and Immunooncology International Cancer Conference (Cairo, Egypt), the Gordon Research Conference (GRC) on Chemical Oceanography: Fingerprints in the Ocean (Manchester, NH), The Florida Undergraduate Research Conference (Tampa, FL), and the Transition Analytics for Decarbonization (TAD) Conference (Paris, France). In 2025, the ICR program also organized the 14th North American FTMS Conference, which attracted top scholars in the field to Lake Tahoe, CA. The conference provided financial support for graduate students and postdoc attendees.

Education and Training

The ICR program provides education and training to students, postdoctoral associates, faculty, and technical staff. In 2025, one ICR staff member and one postdoc served as instructors on various topics at the Cold Spring Harbor (NY) proteomics course, a ten-day training intensive workshop on mass spectrometry that includes hands-on, individualized training in software and data processing for all users, along with tutorial workshop-style lectures. Prof. Hakansson taught an introductory analytical chemistry course at FSU in Fall 2025 with one postdoc as a guest lecturer.

The ICR Facility had several undergraduate students performing research in our program, including students from the Biology, Chemistry, and Computer Science Departments. Four new Chemistry graduate students were recruited to the program in 2025, as well as three new postdocs. Computer science graduate students are working under the supervision of Ryan Rodgers, Lissa Anderson, and David Butcher. Huan Chen is co-supervising graduate students in the Department of Civil and Environmental Engineering at the FAMU-FSU College of Engineering. Lissa Anderson worked with a high school student. Martha Aguilera and Kristina Hakansson supervised undergraduate students through the 2025 MagLab REU program.

Stem Outreach

The ICR Facility actively participates in STEM outreach in local K-12 schools in Leon, Gadsden, Franklin, Jefferson, and Wakulla counties, with demonstrations designed to highlight fundamental principles of ICR. Several ICR staff also participate in the MagLab's Magnetic Momentum Scholars program.

2.7 NMR/MRI FACILITY

The *NMR/MRI User Program* at the MagLab in Tallahassee (FSU) is partnered with the *AMRIS User Program* in Gainesville (UF). The research facility in Tallahassee includes solid-state NMR (ssNMR) applications to materials science, chemistry, biology, and biochemistry, along with *in vivo* magnetic resonance imaging (MRI) of small animals and tissues. The NMR/MRI team comprises the *NMR Instrument Managers* (6 Research Faculty, 1 technical staff, 1 Postdoc), the *NMR Technology Group* (5 Research Faculty, 2 Technical Staff), the *Affiliated Faculty* (5 Affiliated Professors), and the *Management Team* (1 Director, 1.33 Support Staff). There are fourteen active NMR platforms on site, including three flagship instruments supported by the NSF core grant, including **(i)** the 36T Series Connected Hybrid (**36T-SCH**) platform, which operates at 35.2T/1.5GHz for ^{1}H NMR, making it the highest-field magnet for NMR in the world; **(ii)** the 14.1T/600MHz/395 GHz MAS dynamic nuclear polarization (**600-DNP**) NMR platform (which also includes an Overhauser DNP setup for liquid-state NMR, **600-ODNP**); **(iii)** the 21.1T/900MHz (**900-MRI**) ultrawide bore (105mm) MRI platform, which is currently the highest-field MRI/S instrument in existence. In addition, there are **(iv)** one 20.0T/850MHz (**850NB**) and two 18.8T/800MHz platforms (**800#1**, **800#2**), which are configured for biosolids and materials ssNMR, as well as for methods development and staging of UHF NMR experiments on the flagship platforms. These instruments are unique, in part, due to their coupling with unparalleled staff expertise and some of the world's best NMR probes with multi-nuclei and channels, which are designed and constructed by our *NMR Technology Group*. Additionally, there are a series of moderate-field instruments (**600#1**, **600#2**, **600#3**, **600-SOL**, and **500**), which are essential for triaging experiments, running unique high-temperature and/or ^{1}H/^{19}F/X (HFX) experiments, testing new HTS solution NMR probes, and supporting the research of numerous users from around the U.S. and the world.

The NMR/MRI User Program, which is run by our Research Faculty, Technical Staff, and Affiliates, annually serves *ca*. 225-375 users from around the world, including PIs, students, postdocs, and technicians. In 2025, our number of users was **225**, lower than in previous years (2024: **250**, 2023: **341**, 2022: **352**, 2021: **311**, 2020: **234**, 2019: **286**). Again, the deficit of users was again due to the **36T-SCH** being continuously down because faulty current leads, which resulted in no experimental time in 2025 and 2026. Finally, the number of peer-reviewed publications from the NMR/MRI User Program for 2025 was **71**, much higher than in 2024 (53).

We continue supporting our users associated with the NIH RM1 grant (GM148766) obtained in April 2023 by Drs. Rob Schurko (FSU/NHMFL), Bill Brey (FSU/NHMFL), and Joanna Long (UF/AMRIS) for the *National Resource for Advanced NMR Technology*, which supports three Technology Development Projects (TDPs), including **TDP1** - *High Sensitivity NMR of Mass Limited Samples, Complex Mixtures, and Structural Biology*, **TDP2** - *Dynamic Nuclear Polarization NMR*, and **TDP3** - *Biomedical NMR Research Beyond the Reach of Conventional NMR Magnets*. This RM1 grant supports personnels in the *NMR Technology Group* (2 Research faculty in full, plus partial to others) by developing new probe technology in addition to maintain existing probes for the user program.

OPERATION OF A WORLD-LEADING HIGH-MAGNETIC-FIELD USER PROGRAM

Unique Aspects of Instrumentation Capability

Ultra-High Field (UHF) NMR: 36T-SCH: The **36T-SCH** platform has resulted in **74** peer-reviewed publications since its commissioning in November 2018 (including **6** in 2025, **8** in 2024, **9** in 2023, **11** in 2022, **9** in 2021, and **14** in 2020). Unfortunately, there was no experimental time on the **36T-SCH** in 2025 (usually, between 90-100 days are allotted) due to a series of issues. First, one of the six room-temperature circuit breakers overheated during normal operations. The magnet was restored to operation after repair in December 2024/early January 2025. Then, the HTS portion in one of the current leads became resistive. After an extensive root cause analysis, the damaged lead is in the process of being re-built. The **36T-SCH** magnet is scheduled to be back in operation in Q1 2027.

With growing competitions from a handful commercial 1.2GHz NMR instrumented being installed around the world, data acquired on the **36T-SCH** before 2024 continue to prove their value from the highest magnetic field for the ssNMR of half-integer quadrupolar nuclei (*i.e.*, nuclear spins of 3/2, 5/2, 7/2, and 9/2, which constitute 73% of NMR-active nuclides in the periodic table) in a wide range of materials, as evidenced by **6** publications in 2025. The **36T-SCH** affords enormous gains in signal especially for low-γ and natural abundant nuclei such as ^{17}O ^{25}Mg, ^{91}Zr and ^{99}Ru and resolution since the central transition (CT, $+½ \leftrightarrow -½$) patterns of half-integer quadrupolar nuclides narrow as the inverse of B_0. It also enables rapid acquisition of ultrawide patterns by stepping the magnetic field as demonstrated for those nuclei which possess very large quadrupole moment such as ^{79}Br, ^{127}I and ^{209}Bi. However, the continuing down time of **36T-SCH** has reflected in the lower user count for 2025 and will impact the publications for the future.

DNP NMR: 600-DNP/600-ODNP: The 600MHz DNP platform, a joint effort between NMR, AMRIS, and EMR that opened for users in late 2018, has yielded **70** publications to date. It features the most efficient high field (*i.e.*, ≥ 600MHz/395GHz) MAS DNP instrument in the world serving a large user base (it accounts for ~40% of all publications from DNP platforms of 14.1T or higher worldwide). This unique DNP platform

has both MAS DNP ssNMR (**600-DNP**) and Overhauser DNP (**600-ODNP**) instruments with a quasi-optical table (built-in-house) that splits the μw beam from one gyrotron source to two separate magnets for solids and solutions platforms, respectively.

The **600-DNP system** managed by Drs. Fred Mentink-Vigier and Thierry Dubroca and assisted by postdoc Dr Shubha Gunaga operates continuously (24/7) supporting users over the world and across the career spectrum, including early-career professors without routine access to DNP NMR. A benchtop EPR spectrometer and spinner are available for sample screening and minimizing probe damage. **600-DNP** had **232** magnet days in 2025, close to the maximum of 240 days allowed annually after *ca*. 30 days for service and downtimes. **600-DNP** platform was upgraded in February 2024 with a 395GHz gyrotron from Bruker to replace the previous 10 years old and a Bruker NEO console (the older console was repurposed to **600#2**). A new cooling cabinet was purchased in 2026, thanks to the supplement funding of NIH RM1 (GM148766) grant. In-house development of MAS-DNP NMR probes continued in 2025 by the team of P. Gor'kov, W. Mao, F. Scott, and F. Mentink-Vigier. The 1.3mm HXY low-temperature (100K) DNP MAS probe (#65) was completed in December 2024 and we continue filling the number of tuning configurations for multi-nuclei DNP and improve the robustness of 1.3mm DNP MAS probe for routine user operation. The 1.9mm HXY low-temperature (100K) DNP MAS probe (#67) is still in progress, anticipating completion in 2026. We started implementing two new tools in 2026: an in-situ EPR detection and an adapter that will allow spinning and cooling with helium gas for faster spinning and lower temperature.

The 600-ODNP, supported by NSF-CHE 1808660 and 2203405 grants, aims at enhancing solution NMR signal through Overhauser effect. The system is equipped with a Tecmag Redstone console and operates two uniquely modified ODNP probes converted from conventional H(F)X and HXY liquid-state probes. In 2025, the team with Drs. Lucio Frydman, Sungsool Wi, Thierry Dubroca, Tomas Orlando and postdoc Jenica Lumata, has achieved ^{31}P, ^{13}C and ^{15}N DNP enhancements of up to several tenths—an unprecedented performance for 100μL sample volume and at 600MHz field.

In 2024/2025, Drs. Schurko and Mentink submitted an NSF Mid-scale RI-1 proposal entitled, "*Mid-scale RI-1 (M1:IP): National Facility for Ultra-High Sensitivity Solid-State NMR*", which proposes the first ever ssNMR spectroscopy platform combining MAS DNP and cryoMAS at 1GHz field serving researchers from across the U.S. and around the world. This 1.0GHz/54mm bore/658GHz DNP and CryoMAS ssNMR platform will include a 23.5T magnet, a 1.0GHz spectrometer, a 658GHz gyrotron (for DNP) from Bruker, and an assortment of DNP and CryoMAS probes. This NSF Mid-scale RI-1 proposal is pending for decision.

900-MRI. The 900MHz/21.1T ultra-wide bore (105mm) magnet, which was built in-house at MagLab, has been in operation since 2005, yielding **132** publications. It is largely used for MRI of small animals and *in vivo* MRI studies, which are made possible by the 105mm bore; however, it is also used for ultra-wideline NMR of unreceptive nuclei. The **900-MRI** control room, which has cryogenics controls and electronic safety equipment is approaching the end of life (it is over 20 years old). Work is underway to replace this equipment to safeguard this MagLab's flagship instruments. We note that the **500** platform augments MRI capabilities and provides a staging ground for experiments at 900MHz. It is equipped with *in vivo* MRI, microimaging, diffusion, and MR rheology instrumentation from previous systems or built in-house. ^{7}Li imaging and diffusion measurement are developed on both **900-MRI** and **500** for batteries and other kinds of materials.

ssNMR from 800-850MHz. The **800#1**, **800#2**, and the **850NB** (acquired in 2024) platforms are our high-field workhorses that serve a large community of users who require access to high-field ssNMR and have yielded hundreds of publications over the last 10 years. In addition to the time capacity of three instruments to serve wide user base, these platforms are unique due to the (i) wide array of probes that are available with virtually any tuning configurations that our users need (15 different probes are in service from 800-850MHz) and (ii) unmatched expertise in the development of NMR methods and applications of complex experiments to solve challenging problems in chemistry, materials science, and biology. The **850NB** was acquired in 2024 to replace the previous **830** magnet that quenched in November 2022. It inherited **830's** 2018-vintage NEO console and home-built probes for the 31mm bore. During 2025, the NMR Technology Group commissioned two new probes for **850NB**: a 1.3mm HX(Y) MAS probe and a 2.5mm HX low-E probe. Both probes take full advantage of larger bore size of the **850** relative to that of the **830** (*i.e.*, 54mm vs. 31mm, respectively). The 1.3mm MAS probe introduced for the first time ^{1}H-detection capability with fast MAS for low-γ and quadrupolar nuclei at the 850MHz field. The 2.5mm MAS probe increased the maximum spinning speed and *rf* field strength over the previous 3.2mm probe for higher *rf* field and samples with large quadrupolar couplings. A low-temperature (~70K) 5.0mm static HX probe was launched with **800#2** in 2025 The probe purchased from Phoenix NMR (Loveland, CO) provides users with unique capabilities of variable-temperature for studies of molecular-level dynamics and prolonging T_2 relaxation time which is critical for QCPMG ultra-wideline NMR studies of unreceptive nuclides.

ssNMR at 600MHz. The **600#1** and **600#2** platforms continue to be of vital service to our users, providing opportunities for routine experimentation, triaging for higher fields, and unique HFX and H(F)XY capabilities. A new **600#3** platform is launched in 2025 with a magnet donated from University of Central Florida and an Avance-III HD console brought from University of Michigan with Ayyalusamy Ramamoorthy.

A BlackFox 3.2mm HCN MAS probe from the original owner is available with **600#3** providing routine ^{13}C and ^{15}N CPMAS and conventional triple-resonance MAS NMR capabilities for bio-solids.

Major Research Activities and Discoveries

36T-SCH: The **36T-SCH** system managed by Drs. Zhehong Gan and Ivan Hung and supported by the RF group continues to publish ssNMR results acquired before the magnet went down providing significant enhancements in both signal and resolution especially challenging half-integer quadrupolar nuclei as demonstrated below.

Halat *et al* (*J. Am. Chem. Soc.*, 147 **2025**, 27949-27961) used ^{25}Mg quadrupolar Carr-Purcell-Meiboom-Gill (CPMG) NMR to study antiperovskite solid electrolytes. **Figure 2.7.1** shows dramatic narrowing of the ^{25}Mg quadrupolar patterns and, together with enhanced signals by the high field of **36T-SCH**, the rapid acquisition of the whole pattern became possible in 30min as compared to two days on an 800MHz (18.8T) and two weeks on the 500MHz (11.7T) acquired at the users' own lab. Other highlights are the following: Y. Huang's group at U. of Western/Canada utilized the field stepping capability of **36T-SCH** to acquire ultra-wideline ^{209}Bi and ^{127}I solid-state NMR spectra for characterization bismuth- and iodine-containing metal–organic frameworks (MOFs) (*J. Am. Chem. Soc.*, 147 **2025**, 10823-10828). The unprecedent 8–50MHz patterns reveal very large quadrupolar couplings of ^{209}Bi and ^{127}I uncovering key structural details on dehydration, guest adsorption, phase transitions, and disorder in the MOFs; ^{91}Zr NMR is challenging but very sensitive to differences in MOF short-range structure caused by guest molecules, linker substitution and post-synthetic treatment. W. Zhang *et al* carried out static ^{91}Zr ssNMR of a series zirconium MOFs (UiO-66, MOF-801and 808, and DUT-68 and 69) with fields up to 36T and utilized density functional theory (DFT) calculations to gain these information (*Physical Chemistry Chemical Physics*, 27, **2025**, 4704-4716); ^{99}Ru is another challenging target for analysis by ssNMR. Schurko's group at NHMFL/FSU used **36T-SCH** to measure ^{99}Ru EFG and chemical shift tensors and together with DFT calculation developed a protocal for the characterization of a wide range of Ru-containing compounds relevant to catalysis, advanced materials, and electronic devices (*J. Am. Chem. Soc.*, 147 **2025**, 20865–20877); Last but not least, Laurencin's group from U Montpellier/France utilized the high fields at the NHMFL to acquire ^{17}O and ^{43}Ca spectra as a part of multinuclear ssNMR study of octa-calcium phosphate, a widely studied material for bone substitution and precursor in biomineralization (*Faraday Discussions*, 255, **2025**, 451-482).

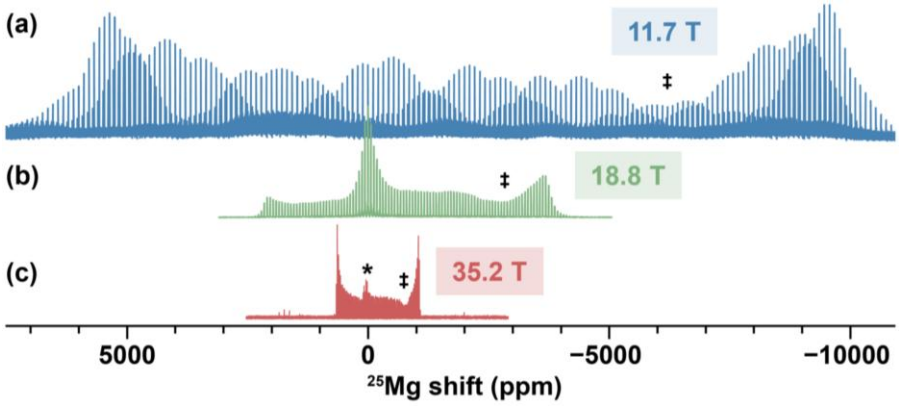

Figure 2.7.1 *Variable-field ^{25}Mg solid-state NMR spectra of Mg_3AsN acquired at field strengths of (a) 11.7T, (b) 18.8T, and (c) 35.2T. Acquisition times of 2 weeks, 2 days, and 20 minutes, respectively, were required.*

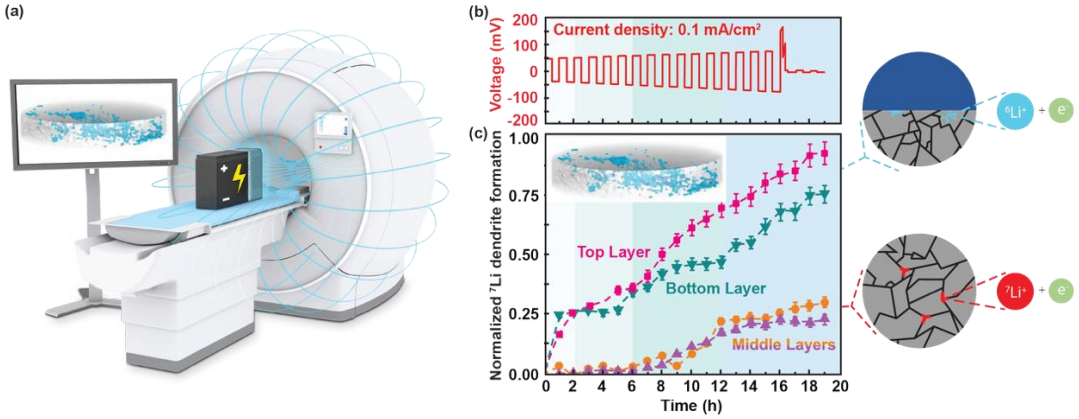

Figure 2.7.2 *(a). schematic illustrating in situ ^{7}Li MRI applied to functional solid-state batteries (b) the electrochemical cycling profile of the battery during the in situ MRI acquisition, (c) the 3D ^{7}Li MRI imaging of dendrite (blue) formed in batteries and the quantified amount of dendrite formed vs time at the interfaces.*

900-MRI: The flagship **900-MRI** platform, the highest-field MRI system in the world, has been used from localized ^{1}H NMR spectroscopy to $^{23}Na/^{1}H$ small animal imaging and ^{7}Li imaging of batteries. Y. Hu's group (NHMFL/FSU) utilized ^{7}Li imaging to investigate the formation of dendrite in all-solid-state Li/LLZO/Li

batteries. The dendrite image acquired in situ (**Figure 2.7.2 c**) reveals various stages of chemistries involved in Li dendrite formation for various layers inside the battery (*Nature. Materials*. 24 **2025**, 581-588). Bhagu *et al* investigated monoclonal antibodies (mAb) exposed to air-water or oil-water interfaces that may trigger partial unfolding of mAb. The localized ^{1}H NMR spectroscopy at the 900MHz field offers the potential to probe and quantify alterations of mAb properties near interfacial layers. (*J Pharml Sci*, 114 **2025**, 103685). Helsper *et al* applied ^{23}Na/^{1}H MRI and MRS at 900MHz field in therapeutic assessment of iron oxide labelled extracellular vesicles (*J Extracell Biol,* 4 (7), **2025** e70063).

600-DNP continued to produce a large number (**17)** of publications enabled by the sensitivity enhancement from MAS DNP. T. Wang's group from Michigan State U. detected a previously unidentified minor α-1,3-glucan via DNP in Cryptococcus neoformans pathogenic fungus (**Figure 2.7.3)**. These polysaccharides in Figure 2.7.3.c interact with chitin, chitosan, and β-glucans to create a molecular scaffold that underlies virulence and antifungal resistance. (*Ange Chem Intern Ed*, **2025** e202510409). Wang's group has carried similar studies utilizing MAS DNP of cell wall structure in Aspergillus species (*Carbohydrate Polymers*, 348, **2025**, 122907) and Candida albicans (*Nature Communications*, 16 (1), **2025** 6295). U. Akbey from U of Pittsburg employed ultrasensitive DNP ssNMR to characterize a native bacterial biofilm. (*Ange Chem Intern Ed*, 64, **2025** e202418146). This pioneering work expands the capabilities of ssNMR for analyzing a wide array of in vitro and ex vivo biofilms accelerating structure-guided efforts to combat infections caused by biofilm-forming microbes. Q. Qiang from SUNY Binghampton used DNP ssNMR confirming long-range tertiary contacts at early stages of nucleation of β-amyloid Aβ1-42 (*Communications Chemistry*, 8 **2025**, 1-10). In-house by Orlando *et al* and collaborative by Chatterjee *et al* research by have been carried out on the impact of non-polar solvents in high-field Overhauser DNP (*J. Magn. Reson*. 375, **2025**, 107885) and on the understanding the role of protons near biradicals to overall MAS-DNP enhancement (*J. Phys Chem Lett*, 16, **2025** 635-641).

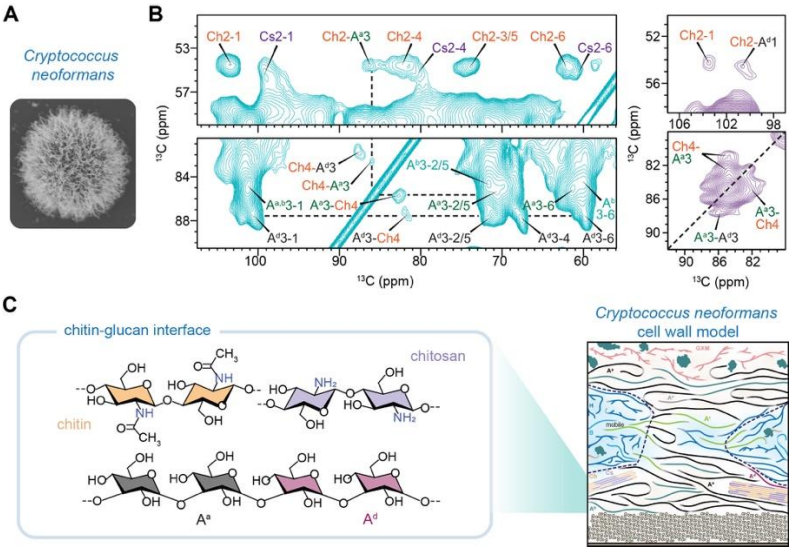

Figure 2.7.3 *Solid-state NMR of intact Cryptococcus cells reveals five forms of α-1,3-glucans (Aa, Ab, Ac, Ad, and Ae) in its cell wall that structurally bridge melanin and capsule layers.*

Other Major ssNMR Instruments: Our 850, 800(×2), 600(×3), and 500MHz platforms are the workhorses for the majority of high- and moderate-field ssNMR experimentation, as well as serving as screening platforms for flagship instruments. The **800#1**, **800#2**, and **850NB** are of importance for ssNMR of biosolids (due to high sensitivity and large chemical shift dispersions) and for half-integer quadrupolar nuclides in chemicals, pharmaceuticals, and a wide range of materials (again, due to narrowing of CT powder patterns proportional to B_0^{-1}). The 600(×3), and 500MHz platforms act in support of these instruments with some unique opportunities like ^{1}H-^{19}F-X ssNMR, ultrahigh temperature MAS NMR (*ca*. 700°C) with laser heating, and MRI and diffusion measurements.

A wide range of multinuclear ssNMR studies have been carried out for: **(a) Batteries and Energy Storage** such as ionic conductors (*ACS Materials Letters*, **7 2025**, 4029, *Chem Sci,* 16, **2025**, 19857, *Chem. Sci*, 16, **2025** 10372, *Sci Adv*, **11** 2025, 7795, *Solid State Ionics*, 429, **2025** 116962) and battery materials (*Chem Material*, 37 **2025** 6059); **(b) Biosolids and Biomaterials** including lipid membrane (*Biomolecules*, 15, **2025**, 994), and membrane protein (*J. Am. Chem. Soc*, 147, **2025** 11117); and **(c) Chemicals and inorganic materials** of molecular thermometer (*Inorg Chem*, 64 **2025** 6531) and glasses (*J. Phys. Chem. C*, 129 **2025** 6869).

The ssNMR platforms were also used to develop new methods: ^{1}H-Detected ^{103}Rh and ^{99}Ru NMR of static solids based on the PROSPR mechanism (*J. Phys. Chem. Lett* 16 **2025** 4596); ^{1}H-Detected ssNMR under fast MAS condition for cellular carbohydrates (*J. Am. Chem. Soc* 147, **2025** 17416); using ^{2}D and ^{17}O ssNMR to study the dynamics of hydration shell water near proteins (*J. Chem. Phys*. 163, **2025**, 25101); widening the range of molecular dynamics probed by ^{17}O T_2 relaxation via satellite transitions (*Solid State NMR* 137, **2025** 102004); applying ^{17}O ssNMR and ^{1}H-^{17}O distance measurements to characterize Low-Barrier Hydrogen Bonds (LBHB) (*J. Phys, Chem. A* 129 **2025**, 5993)

CARRYING OUT IN-HOUSE RESEARCH AND SCIENTIFIC INSTRUMENTATION DEVELOPMENT IN SUPPORT OF THE USER PROGRAM

Probes

The probes designed by the *NMR Technology Group* are a major factor in setting the MagLab apart from other facilities around the world and keeping our user program on the cutting edge. This team, led by Dr. W. Brey and P. Gor'kov, designs, manufactures, and implements probes of high quality and versatility. They provide wide range of tuning configurations in response to users' need for multinuclear ssNMR, low-*E* coils for lossy biosolids samples, and some of the best rf circuits and coils for detecting weak NMR signals.

***New Probes, Tuning Configurations, and Related Hardware* (2025)**

- **900-MRI**
  - Developed dual-resonant birdcage volume coils in $^{1}H/^{2}H$ and $^{1}H/^{31}P$ configurations.
  - Designed and tested a ^{1}H quadrature surface coil for mouse Alzheimer's studies.
  - Cost-effective RF shield development for ultra-high field MRI coils.
- **850NB**:
  - 3.2mm HX MAS low-E probe **#68** for materials and biosolids application - the new probe takes advantages of relatively large volume (44µL) and spinning speed (24kHz) of Bruker-style rotor over the previous RevNMR pencil type rotor (36µL and 20kHz). This probe replaces the retrofitted 3.2mm MAS from the quenched 830NB magnet and is in the process filling the bank of swappable tune cards following users' demands and eventually covering 75% of all nuclides ≤ ^{31}P including some of the very low-gamma nuclei.
  - 1.3mm HXY MAS probe **#69** for materials and biosolids applications with ^{1}H-detection and 60kHz MAS speed - this probe enables ^{1}H-detected experiment for the first time with **850NB**. The probe is configurable in 2-resonance mode to observe majority of isotopes in periodic table and 3-resonance mode covering many XY isotope combinations from ^{31}P and below. It is currently used in 2-resonance mode until acquisition of 3rd channel for the **850NB** NEO console.
  - 2.5mm HX MAS probe **#63** for materials and bio application with 2-resonance configuration, 20µL sample volume and 29kHz speed – this probe expands range of quadrupolar broadening over 3.2mm probe with faster spinning speed and larger *rf* field.
- **800#1/800#2**:
  - 2.5mm HX MAS probe **#66** for materials application with 2-resonance and 2.5mm 20µL pencil rotor capable spinning up to 29kHz MAS. This probe expands the range of observable isotopes over the 3.2mm probes originally designed for bio-solids applications. This probe, released in 2023, now covers 80% of NMR-active nuclides in the periodic table.
  - 3.2mm HXY MAS probe **#53** (bio, 3-res, 36µL, 18kHz MAS) – – created new tune cards to accommodate ^{1}H-^{31}P-^{17}O and ^{1}H-^{13}C-^{85}Rb triple-resonance experiments.
  - 5mm HX static probe with low temperature capabilities from Phoenix is commissioned after damaged rf coil was repaired.
- **600-DNP**:
  - 1.3mm HXY low-temperature (100K) DNP MAS probe **#65** – completed and released to users in 2025. Optimizing robustness of spinning at low temperature and expanding array of X-Y isotope combinations with new 3-resonance tune cards are ongoing along with user operation. The rf circuit is upgraded with additional switch to ^{19}F-X-Y 3-resonance mode for decoupling at ^{19}F frequency.
  - 3.2mm HXY low-temperature (100K) DNP MAS probe **#61** – Expanding array of covered X-Y isotope combinations with new 3-resonance tune cards, per users' demands. The rf circuit is upgraded with additional switch to ^{19}F-X-Y 3-resonance mode for decoupling at ^{19}F frequency.
  - 1.9mm HXY low-temperature (100K) DNP MAS probe **#67** – in construction phase, ETA 08/2026
- **600#1/#2:**
  - 1.3mm HFXY MAS probe from Phoenix NMR (materials, 60kHz speed) – delivered in 2025.
  - Static goniometry probe **#37** (crystals, operational since 2024) – upgrade is made to rotator sample holder.
- **800 at AMRIS**
  - 3.2mm HXY MAS low-E probe (bio) built by the NMR instrumentation group for UF in 2024 – created new tune cards for additional 3-resonance experiments including ^{1}H-^{31}P-^{13}C, ^{1}H-^{13}C-^{29}Si.

Probes Under Planning

- Static single-resonance probe for **850NB** with interchangeable coil platform for low-γ and wideline NMR of insensitive quadrupolar nuclei.
- 0.7mm HCNO MAS probe – the ultimate probe for quad-resonance ssNMR of labelled proteins and peptides for **800#1** and **800#2**
- 1.3mm HFX fast MAS probe for **800#1** and **800#2**
- 5mm probe for *in situ* study of charging/discharging batteries for 400 MHz

Platform upgrades.

- **600#3**: a 600MHz wide-bore Agilent magnet was obtained from donation by the University of Central Florida, fitted with an older Avance-III HD 500MHz console from University of Michigan. The console reconfiguration, integration with Agilent shim and the 3.2mm HCN MAS probe made by BlockFox were completed in 2025. **600#3** became a part of the NMR user facility since January 2026 relieving the **600#1** and **600#2** platforms.
- **400**: a 400MHz Bruker magnet was obtained from donation by Sanford Burnham and integrated with Avance-3 HD console from University Michigan in 2025. This system is primary used for in situ battery NMR, triaging experiments that require lower fields, and testing SCH field regulation equipment. A 3.2mm HX MAS probe with variable temperature has been ordered expecting delivery in Q2/2026. Once this probe is commissioned, we plan to retire the unshielded 300MHz magnet.

Issues and Concerns

- **Computer OS and software upgrade** have become a serious issue to meet mandatory security requirement. Aging instruments can be run only with older versions of software that are not compatible with the minimum level of operating systems that meet security requirement. We are facing the dilemma between costly upgrades or being unable to be connected to the internet.
- **36T-SCH**: Offline from December 2024 due to a faulty current lead. The redesign and rebuild of both current leads is expected to finish in Q1 2027.
- **900-MRI**: Replacement of control room electronics (cryogenics controls and safeties) – fund has been allocated and the work is in progress.
- **800#1**: We had issues with multiple components of the aging Avance-3 HD console in 2025: the X 1kW-amplifier outputs ~1/3 of its specs power; the ^{1}H 1kW amplifier has abnormally high noises level at low frequencies affecting X-nuclei detection; both SGU boards were unstable resulting significant loss of users' time in 2025. Upgrading the 14-year-old console is our top priority for upgrade.

MAINTAINING FACILITY AND DEVELOPMENT OF NEW MAGNET SYSTEM INCLUDING OPERATION SCHEDULE AND SHUTDOWNS

Facility Plans and Directions

2024 saw the departure of imaging research faculty **Dr. Shiho Cho**, and the retirement of bio-solids research faculty III **Dr. Riqiang Fu**. **Dr. Samuel Grant** took an extended medical leave from 2024 leaving a void in prime activity of MRI/MRS for the flagship **900-MRI** system. On the positive side, we hired **Dr. Sean Holms** to fill the position vacated by Dr. Amrit Venkatesh who moved to University of Virginia as an Assistant Professor in 2024, and promoted **Dr. Faith Scott** (previously a postdoc at MagLab under the supervision of Drs. Schurko and Mentink-Vigier) to the research faculty I position vacated by Dr. W. Mao who took a position at United Imaging Healthcare in Wuhan, China in 2024. **Dr. Holms** will help maintain the expertise of DFT calculation and NMR crystallography. We continue to have one postdoc **Dr. Shubha Gunaga** funded through the RM1-GM148766 grant sharing between the 36T-SCH and 600DNP platforms. Overall, we are experiencing staff shortage especially on the MRI/MRS side.

The NSF core funding cuts (2023–2027) to the NMR/MRI User Program have had significant impacts, however` the program remains strong and dynamic, with generally high morale. We are continuing to pursue initiatives including: (i) Continued expansion of the scope of UHF and DNP activities with the funding of the *National Resource for Advanced NMR Technology* (RM1-GM148766); (ii) a NSF RI-1 proposal titled, "*Mid-scale RI-1 (M1:IP):National Facility for Ultra-High Sensitivity Solid-State NMR*" to obtain the world's first 1.0GHz DNP/CryoMAS NMR spectrometer is pending for decision in 2025; (iii) the planned submission of an NSF-RI2 to acquire the world's first 1.4 or 1.5GHz ssNMR spectrometer (in collaboration with Bruker), which would open unprecedented opportunities in application of ssNMR to materials, chemical compounds, and biosolids with 7/24 access; (iv) the continued design, construction, and commissioning of new NMR probes, including a 1.9mm HXY DNP MAS NMR probe and several new probes for **850NB, 800#1** and **800#2** [Gor'kov, Brey, Kitchen, Scott]; (v) commissioning of the Phoenix NMR "HFX" (^{1}H-^{19}F-X) 1.3mm fast MAS probe for 600#2, to enable studies on pharmaceuticals and other fluorine-containing samples [Gor'kov, Kitchen, Schurko].

NMR/MRI Facility Operations Schedule

The majority of our instruments operated at near 100% capacity (*i.e.*, 365 user days, **Figure 2.7.4)**, including **900-MRI**, 800**#1**, **600#1**, and **600#2**. The **850** platform gave us **339** user days. The **800#2**, offered **352** user days The **600-DNP** platform has a record 261 magnet days in 2025 (above the predicted 240 days). The HTS solution probe is still under development on 600 MHz 52 mm with 57 days usage. Our average subscription rate is ~112% (*i.e.*, 12% oversubscribed). Drs. Z. Gan, I. Hung, S. Holms, S. Wi, F. Mentink, T. Dubroca, and A. Blue continue to be responsible for great success on these instruments, in terms of doing great science and keeping the instruments and probes in top condition. Furthermore, our robust remote operation routines developed during the COVID pandemic continue to assist users with remote access to our spectrometers.

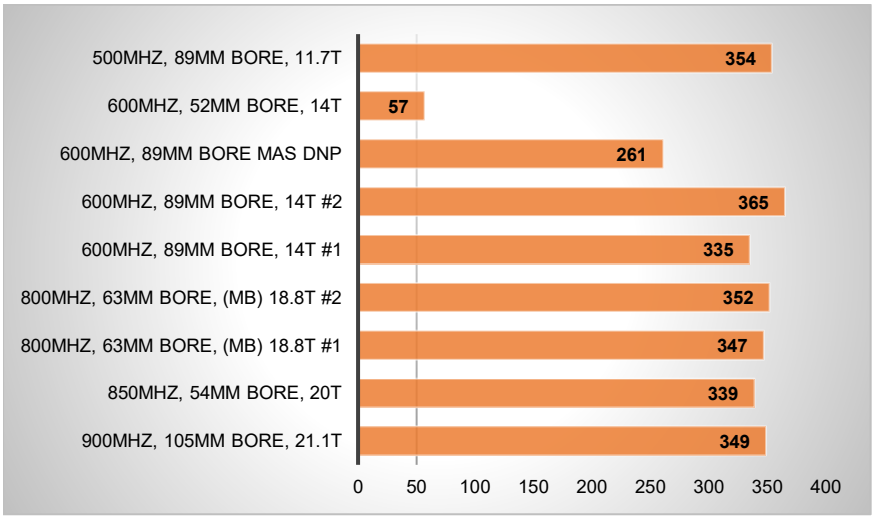

Figure 2.7.4. *User magnet time on major NMR/MRI platforms at the NHMFL in 2025.*

EDUCATION AND TRAINING

The NMR/MRI team had another great year in educational and training outreach activities.

(a) Workshops, Symposia, and Scientific Engagement

The NMR/MRI faculty organized and contributed to multiple training workshops, domestic meetings, and international symposia that strengthened user expertise in ssNMR, DNP NMR, and MRI RF coil development. They also served in leadership roles—including program committee members, chairs, and co-chairs—helping expand the visibility of the MagLab and deepen engagement across the broader magnetic resonance community.

- M. Elumalai organized a 5-day Microimaging RF Coil Workshop (August 11–15, 2025). Six participants received training in RF coil design principles and gained hands-on experience constructing 500MHz birdcage volume coils for preclinical imaging. The program also included a one-day online Bruker ParaVision training taught by Bruker engineers and an in-person full-day electromagnetic simulation session delivered by COMSOL engineers. Additional technical lectures and practical sessions were provided by J. Kitchen, S. Ranner, W. Brey, and I. Litvak.
- A two-week PANACEA-supported Summer Research Visit (August 18–29, 2025) provided an intensive international training experience through the Pan-European Solid-State NMR Infrastructure for Chemistry-Enabling Access (PANACEA) program. Seven overseas participants received in-depth instruction in SSNMR, DNP NMR, and EPR spectroscopy, along with hands-on experience in hardware development. The program included lectures, practical demonstrations, and supervised instrument time led by F. Mentink-Vigier, F. Scott, W. Brey, I. Litvak, T. Dubroca, and M. Elumalai.
- A weeklong workshop on theory and practical applications of DNP-enhanced MAS ssNMR was conducted concurrently with the PANACEA visit. Seven U.S.-based participants joined the seven international participants of PANACEA visit for lectures and hands-on sessions covering MAS DNP, Overhauser DNP NMR, and SSNMR. The workshop was organized by F. Mentink-Vigier and F. Scott, with lectures and practical instruction provided by R. Schurko, W. Brey, Z. Gan, I. Hung, S. Holmes, T. Dubroca, S. Gunaga, and S. Wi.
- MagLab Summer School on Solid-State NMR Spectroscopy was held May 12–16, 2025. R. Schurko and Robbie Iuliucci led the school with support from F. Scott, F. Mentink-Vigier, P. Gor'kov, A. Ramamoorthy, S. Holmes, Z. Gan. I. Hung with more than a dozen lectures covering a broad range of NMR topics, a career panel, six facility tours, data-analysis workshops, and hands-on laboratory sessions on sample preparation, hardware, and experimental setup.
- W. Brey and M. Elumalai served as committee chairs of the 2025 Southeastern Magnetic Resonance Conference (SEMRC), held November 14–16, 2025 at UF–Gainesville.
- A. Ramamoorthy co-chaired "Advances in Biological Solid-State NMR," symposium featured more than 30 invited international speakers.

- A. Ramamoorthy chaired “Protein Aggregation, Biocondensation, and Biomolecular Self-Assembly” symposium highlighted research on molecular mechanisms underlying protein aggregation relevant to ALS, type II diabetes, Alzheimer’s disease, Huntington’s disease, Parkinson’s disease, and other disorders featured 40 invited speakers.
- A. Ramamoorthy organized a Magnetic Resonance Seminar Series featuring speakers from the MagLab (N. Ahmad, R. Smith, and S. Gunaga) and external institutions from France, Italy, and India. M. Elumalai organized a session for NSF-funded REU undergraduates to present their summer research projects and practice conference-style talks.

(b) Student supervision and training. Our team participated in the supervision of graduate (GR), and undergraduate (UG), students through 2025. UG/GR efforts include:

- M. Elumalai supervised 4 UGs and 1 GR in spring (MRI sample development, MRI sustainability – UROP, MRI surface coils, STEM outreach – UROP; mouse quadrature coil development), 1 UG (REU) in summer (RF shielding), and 2 UGs and 1 GR in fall (CST simulations, power-logger setup; dual-resonant coil development).
- Litvak supervised 3 UGs in spring (ferroshim testing; STEM outreach – UROP/InternFSU) and 3 UGs in fall (600-SOL field-homogeneity improvements; STEM outreach – UROP).
- Ramamoorthy supervised 18 UGs, including 4 HITM students, engaged in ongoing laboratory research projects, and 3 high-school students who participated in year-long mentoring activities that introduced them to magnetic resonance research practices and laboratory skills.
- R. Schurko supervised 4 UGs in spring (HITM, UROP, research assistant roles) and 1 UG in summer that introduced them to NMR spectroscopy, spin physics, and applications to pharmaceutical research.
- F. Scott supervised 1 UG in 2025.
- T. Dubroca supervised 3 UGs in spring (3D-printed components for a magnetic resonance spectrometer; solubility studies in various solvents; ferroshims to improve magnetic-field homogeneity), 3 UGs in summer (design of a high-power microwave switch; PFAS solubility and potential for liquid DNP; software control of a spectrometer component), and 6 UGs in fall (manufacturing and testing of a high-power microwave switch; senior electrical-engineering group project to design a double RF-coil NMR probe head for the HiPER spectrometer).

(c) STEM Outreach

STEM outreach continued to be exceptional in 2025. Across 2025, NMR/MRI personnel delivered department-wide outreach to K–12 students and families, the general public, and undergraduate visitors—through STEM nights, school science fairs, camp talks, facility tours, and Title I–focused engagement. Major contributors included I. Litvak, M. Elumalai, F. Scott, R. Schurko, and A. Ramamoorthy, who organized and supported a wide range of activities.

- Neighborhood Camp Fair (K–12, Title I focus): Organized and led by I. Litvak and M. Elumalai, with R. Schurko volunteering. The event drew 60+ attendees from Title I schools and included hands-on science activities led by scientists and graduate students.
- School engagements & science fairs: STEM demos and activities were delivered by I. Litvak (Canopy Oaks; Ft. Braden; Oak Ridge; Hartsfield; Pine View; School of Math and Science), M. Elumalai (Ft. Braden), F. Scott (Godby), and S. Grant (Godby, summer program). In addition, I. Litvak organized judging for the Pine View Elementary science fair competition (K–5).
- Open House: Major participation in the MagLab Open House (February 2025), where W. Brey, J. Collins, M. Elumalai, F. Mentink-Vigier, I. Hung, Z. Gan, S. Wi, A. Ramamoorthy, and F. Scott presented demonstrations and volunteered throughout the event, which welcomed ~10,000 visitors from the general public.
- Media & community programs: F. Scott was featured in the Discovery Education/Sesame Workshop virtual field trip Meet the Magnets. M. Elumalai and S. Grant delivered summer camp talks; M. Elumalai presented to RET teachers; and M. Elumalai and F. Scott led a panel and tours for FAMU Magnetic Momentum Scholars and Miami-Dade students. T. Dubroca delivered a virtual career-development workshop for University of Idaho chemistry students.
- Tours & visiting groups: A wide range of MagLab tours were provided by M. Elumalai, J. Collins, F. Scott, S. Grant, A. Ramamoorthy, T. Dubroca and others. In particular, A. Ramamoorthy led ~25 tours for visitors, faculty candidates, and seminar speakers; provided a tour for 4 Molecular Biophysics graduate-applicant visitors; and hosted 6 international visitors from Sookmyung Women’s University.

2.8 PULSED FIELD FACILITY

The Pulsed Field Facility (PFF), located within Los Alamos National Laboratory (LANL) in Los Alamos, NM, utilizes both LANL and U.S. Department of Energy assets to provide pulsed magnetic fields to our international community of users – from undergraduate students to senior investigators. Along with our magnets, we provide users with robust scientific instrumentation engineered to operate in the transient pulsed magnetic field environment, along with the support of scientists who are active researchers with expertise in high magnetic field-driven science.

OPERATION OF A WORLD-LEADING HIGH-MAGNETIC-FIELD USER PROGRAM

Capabilities

The suite of magnets and associated techniques supported at the PFF are listed in **Table 2.8.1**. At the heart of our magnet operations is a fully multiplexed (9 output) computer-controlled 4MJ, 16kV capacitor bank. Currently, this capacitor bank is responsible for providing power to all operational pulsed magnet systems, including our workhorse 65T Short-pulse magnets and the higher energy 60T Mid-pulse and 75T Duplex magnets. A new magnet cell, rated for 55T maximum field, was built and commissioned in 2025 specifically for studies on actinides and other radioactive materials. LANL is uniquely home to a 1.4GVA generator, which the PFF utilizes as a pulsed-power system to provide the hundreds of megajoules required to run our 100T multi-shot and 60T Controlled Waveform ("Long-pulse") magnets; the former is the first and only magnet in the world to provide repeatable, non-destructive magnet fields for science experiments at 100T. Furthermore, the rectification of the generator output enables the control of the pulsed power waveform, allowing for the optimization of both the 100T and 60T Long-pulse for existing experimental research techniques. Currently, these two magnets are unavailable to users while the generator is under repair.

Table 2.8.1 *Pulsed-field magnets available to users at the NHMFL-PFF*

Capacitor-Driven Pulsed Magnets				
Magnet System	**Bore,³He Sample Space**	**Rise Time, Max dB/dt**	**Pulse Duration**	**Supported Research***
65T Short-pulse (x4)	⌀15mm, ⌀ 9mm	8ms, 8.1T/ms	80ms	Magneto-optics – IR through UV Magnetization – Extraction, Torque Magnetic Susceptibility Magneto transport – DC through MHz; incl. Critical Current Measurements and RF Pulse Echo Ultrasound Spectroscopy Fiber Bragg Grating Dilatometry Polarization Magnetocaloric Sample Temperatures: 400mK to 300K For compatible techniques: Pressures up to 5GPa and in-situ sample rotation
55T Short-pulse for Actinide Science		8ms, 8.1T/ms	80ms	
75T Duplex		1.8ms, 25T/ms (30 - 75T)	80ms	
60T Mid-pulse		32ms, 1.8T/ms	300ms	
Generator Driven Pulsed Magnets**				
Magnet System	**Bore,³He Sample Space**	**Rise Time, Max dB/dt**	**Pulse Duration**	**Supported Research***
100T Multi-shot	⌀ 10mm, ⌀ 5mm	8ms, 7.5T/msec (40 – 100T)	3s	All techniques listed above
60T Controlled Waveform ("Long-pulse")	⌀ 25mm, ⌀ 18mm	Adjustable	3s, Up to 100ms full field flat top	All techniques listed above, plus: Magnetothermal studies (Heat Capacity and Magnetocaloric) Larger Sample Volumes

**Resources available to work with users to develop and field new and novel techniques as needed in our magnet systems.*

***Offline while LANL's 1.4 GVA generator is being repaired.*

User Research Highlights

Magnetic fields typically suppress superconductivity through orbital and Pauli pair-breaking effects. However, as dramatically discovered in UTe_2 at the PFF, extreme magnetic fields can instead stabilize new superconducting states. Now, building on that discovery, high-field studies by two different user teams of the Pulsed Field Facility have discovered that rare-earth substitution in infinite-layer nickelates can induce and enhance superconductivity in fields previously thought destructive. In $Sm_{1-x-y-z}Eu_xCa_ySr_zNiO_2$. measurements up to 70T demonstrate clear magnetic-field-induced re-entrant superconductivity and extraordinarily large upper critical fields. A sample with $T_c \approx 12$ K exhibits two distinct superconducting phases separated in field, while higher-T_c samples show merging of low- and high-field phases and non-saturating H_{c2} (see **Fig. 2.8.1**). Modeling within a modified Werthamer–Helfand–Hohenberg framework indicates a large exchange field (approximately −70T), consistent with a Jaccarino–Peter compensation mechanism arising from Eu-derived magnetic moments. A concurrent study of $Nd_{1-x}Eu_xNiO_2$ by another group likewise discovered magnetic-field-enhanced superconductivity and strong violations of the weak-coupling Pauli limit for both in-plane and out-of-plane field orientations. Density functional theory identifies exchange coupling between Eu *4f* moments and Nid_{x2-y2} electrons that produces a compensation field of order -20T, quantitatively consistent with experiment. Infrared spectroscopy further demonstrates a large superconducting gap corresponding to $2\Delta/k_BT_c \approx 5–6$, providing direct evidence for strong-coupling superconductivity in nickelates. Crucially, these results constitute the first observation of magnetic-field-induced or re-entrant superconductivity in a high-temperature superconductor and may be a platform for engineering significantly large upper critical field superconductors. The 60T Mid-pulse and 75T Duplex magnets at the PFF, coupled with steady state measurements in the 41T resistive magnet and 45T hybrid magnet at the DC facility, played vital roles in these results, enabling users to induce re-entrant superconducting phases and track their evolution with angle of applied field and temperature. Further details can be found at : https://arxiv.org/pdf/2508.15968 and https://arxiv.org/pdf/2508.16290

Nonreciprocal light propagation, an optical “diode” effect, typically requires materials that break both inversion and time-reversal symmetries. This effect has rarely been explored in rare-earth *f*-manifold excitations at technologically relevant wavelengths. A recent study of h-$Lu_{0.9}Er_{0.1}MnO3$ by users of the PFF revealed pronounced nonreciprocal directional dichroism across the telecom E-, S-bands, and C-band (≈1460-1565nm) relevant for optical communications through optical fibers. High magnetic field magneto-optical measurements up to 55T were essential for mapping out the dichroic response as a function of wavelength, revealing strong field-dependent shifts, avoided crossings, and large asymmetry between optical absorption for light propagating in opposite directions (+k versus -k). This demonstrates robust magnetoelectric coupling at high fields. Remarkably, the nonreciprocity persists at low fields and even at room temperature despite the absence of long-range Mn magnetic order. These results open a pathway toward magnetically controlled optical diode functionality in solid-state platforms. Further details can be found at *npj* Quantum Materials 11, 18 (2026)
https://doi.org/10.1038/s41535-026-00848-w

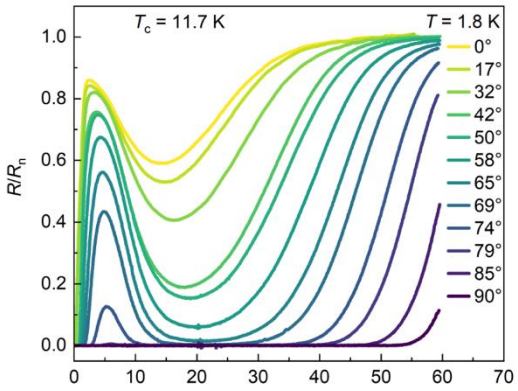

Figure 2.8.1 *Normalised resistance at different field orientations θ, rotated from c-axis (θ = 0◦) toward the a-axis (θ = 90◦) in the nickelate superconductor $Sm_{1-x-y-z}Eu_xCa_ySr_zNiO_2$. Superconductivity is suppressed with a few tesla, but is re-established at larger magnetic fields.*

CARRYING OUT IN-HOUSE RESEARCH AND DEVELOPMENT

In-House Research Highlight

The nature of the Fermi surface in the pseudogap phase of the cuprates has remained one of the central unresolved problems in high-temperature superconductivity. In underdoped $HgBa_2CuO_{4+\delta}$ (Hg1201), pulsed magnetic field measurements up to ~72T now reveal a clear Yamaji peak in the *c*-axis magnetoresistivity above the superconducting temperature $T_c = 74$K, providing direct evidence for closed Fermi-surface pockets in the pseudogap state. The Yamaji effect manifests as a pronounced maximum in magnetoresistivity, a hallmark of warped quasi-two-dimensional Fermi surfaces. From the Yamaji angle, the Fermi surface geometry is extracted directly, implying small elliptical pockets occupying only ~1.3% of the Brillouin zone. The presence of a small Fermi surface absent long-range broken translational symmetry strongly suggests a breakdown of canonical Fermi liquid theory. Observation of the Yamaji effect at elevated temperatures (e.g., 85K) required the use of ultrahigh pulsed magnetic fields to cause quasiparticles to complete coherent cyclotron orbits. The full angular dependence was constructed from many individual high-field pulses, demanding exceptional shot-to-shot reproducibility and magnet reliability

from the 75T Duplex system. Further details at Nat. Phys. 21, 1753 (2025), https://doi.org/10.1038/s41567-025-03032-2

Magnet Development

The implementation of fast-cooling designs across all short-pulsed magnet platforms enabled the Pulsed Field Facility to produce approximately 3,500 pulses at magnetic fields of 60 tesla and higher. Operational reliability was ensured by maintaining a minimum inventory of four spare short pulse magnets and one spare duplex and mid-pulse magnet. The 75T duplex magnet was redesigned to utilize newly developed CuAg conductors to mitigate supply uncertainty of the 1.1GPa CuNb conductor from Russia. The redesigned 75T duplex achieved peak field of 74T for user experiments despite the 25% reduction in conductor strength, significantly reducing supply side risks.

A major focus of the magnet program in 2025 was the completion of critical large coils for the 60T Controlled Waveform (CW) magnet and the 100T outsert magnet, ensuring readiness for user operations when the generator returns to service in 2026. The rebuilt magnets will incorporate a newly developed magnet health monitoring system comprising a distributed network of optical strain sensors. Final assembly of all nine coils for the 60T CW magnet has been accomplished. Furthermore, coil #1 and #2 of the 100T magnet system were completed, and final assembly of the new 100T system will be completed prior to the return of the generator.

MAINTAINING FACILITY AND DEVELOPMENT OF NEW MAGNET SYSTEM INCLUDING OPERATION SCHEDULE AND SHUTDOWNS

Generator Related Activities

In 2025, the effort to return the 1.4GW LANL motor generator to service reached several key milestones. Notably, the fabrication of the replacement rotor reached 95% completion in June 2025. However, subsequent high-voltage testing revealed issues that required significant mediation. Importantly, the necessary rework was completed enabling the rotor to pass the high-voltage retest early in 2026. Throughout the rotor design and construction, the Pulse Field Facility's engineers have been actively engaged with the contractor in monitoring every step of the process to ensure quality and conformity. While the work on the rotor continued in Birr, Switzerland the pulsed field facility's power delivery team has focused efforts on key sub-system upgrade activities. These have included power electronic systems such as the new generator drive and exciter, new sensors and instrumentation to enable additional methods to track facility health for informed planning and maintenance, and inspection and maintenance of the rectification control system (the PSRs). Consistent with the 2024 Facility Condition Assessment, the original equipment manufacturer of the PSRs concluded that whilst currently operational, they are beyond further repair confirming the necessity for immediate replacement of this vital infrastructure for powering the 100T and 60T controlled waveform magnets. This work is planned for 2026, funds permitting. The PFF engineering team has also been instrumental in completing the upgrade of the open loop cooling system that is vital for both helium recovery and reliquification, and generator operation. In short 2025 marked the completion of a multi-year, multi-million dollar project to help ensure reliable Pulsed Field Facility operations in the future through the replacement of the entire open loop part of the system, including the tanks, pumps, cooling towers, and associated foundations and pipes as well as the control systems.

85T Duplex Magnet

Efforts have continued to deliver the 85T all-capacitor bank-driven duplex magnet, a unique magnet that requires the tandem operation of both the 16kV, 4MJ Short-pulse and 18kV, 2MJ 100T capacitor banks. Installation of all hardware and power infrastructure required for the operation of this new magnet is now complete. Separate pulsed power to the insert and outsert magnets, separately, has been successfully delivered. The control software required to operate this system in combined mode is presently being tested with an anticipated commissioning of the system prior to the end of 2026.

Mode of Operation

Jointly with the DC Facility, the PFF solicits proposals through a common call three times a year to streamline the application process and ensure the availability of personnel and magnet resources. The capacitor bank-driven magnets operate Monday through Friday from 7am to 7pm, with a later start of 10am on Mondays due to weekly maintenance. Generally, no more than three pulsed magnets – either three 65T magnets or two 65T magnets and either the 75T Duplex or 60T Mid-pulse – are scheduled for users each week to enable turnaround and continuation of an experiment following a magnet failure. The generator-driven magnets – the 100T and 60T Long-pulse continue to be offline while we await the new rotor for the motor generator.

CONDUCTING EDUCATION AND OUTREACH ACTIVITIES

In 2025, LANL Pulse Field Facility members participated in the 9th annual Los Alamos National Laboratory Summer Physics Camp. The free camp for about 30 middle and high school students from across New Mexico aims to empower students to consider careers in science, technology, engineering, and math (STEM). Activities included coding Arduino boards and hands-on exploration in optics, chemistry, computer

science, and astrophysics. Our staff, comprising scientists, technicians, postdocs, and students — Km Rubi, Shalese Lovell, Danielle Yvonne, Stefan Marinkovic, Tim Noe, Chis Mizzi, and Boris Maiorov — were instrumental in developing and showcasing hands-on magnet-related demonstrations. Students were also given a tour of the PFF facility at LANL. Additionally, throughout the year, many of the scientists at the PFF gave talks about high-field research at universities all over the country.

3 EDUCATION AND OUTREACH

3.1 EDUCATION

The Center for Integrating Research and Learning (CIRL) guides the K-12 educational and broader mentoring efforts of the MagLab's education and outreach mission. Our programs are designed to include research-based best practices in science and engineering education for K-12 students and in mentoring for students, teachers, postdocs, and faculty in STEM. Our staff participate in, and facilitate, professional development in their specific disciplines so that we can ensure the MagLab is aware of best practices for building a more diverse STEM workforce. The K-12 education and broader mentoring efforts would not be possible without the CIRL team. Below are some examples of the leadership and relative professional development initiatives that CIRL staff have engaged in over the last year.

CIRL Personnel Highlights in 2025:

- CIRL's K-12 Education Director, Carlos R. Villa presented at the Florida Association of Science Teachers Annual Conference in Orlando, FL. This year Carlos Villa partnered with Leon County School's 21st Century Program and LCS's Title IV to offer ten activities from the MagLab's Camp TESLA at local schools. This partnership created a curriculum that was offered at Fairview Middle School, Nims Middle School, and Griffin Middle School, all Title I schools. These activities were offered during the 21st Century Summer Schools. Carlos Villa was also asked to assist with science factchecking for Marvel's Iron Man Goes Magnetic (National Geographic Kids Readers), ensuring the story aligned with real-world physics. Originally, Captain America's shield was magnetized, but since Vibranium isn't magnetic, Villa suggested making Thor's hammer magnetic instead, based on its origin in a star rich in iron. This change was adopted, and Villa also contributed trivia questions and verified scientific accuracy throughout the booklet.
- CIRL's Mentoring Director Dr. Kawana Johnson implemented the first MagLab/Lively Professional Development Program in February using funds received from an ECMC Foundation mini grant. The 5-week program exposed a small group of 5 career and technical education (CTE) students at Lively Technical College to skilled technical career paths at the MagLab. Sixteen Lab employees served as role models or general program participants. The program was featured in a video spotlight during the 2025 ECMC Foundation CTE Leadership Collaborative Convening in Austin, TX. Dr. Johnson also presented a session on the program at the 2025 Mentoring Institute and published a related article in the Chronicle of Mentoring and Coaching entitled "Creating a Sense of Belonging by Engaging Skilled Technical Workers as Role Models in STEM." Additionally, Dr. Johnson published an article in the Experiential Learning and Teaching in Higher Education Journal entitled "Mentored Research Experiences and Their Impact on Black Students in STEM."
- CIRL's Director Dr. Roxanne Hughes was invited to participate in the inaugural cohort of the prestigious, newly launched Collaborative for Advancing Science Teaching and Learning in K–12 (CASTL-K12) an initiative led by the Board on Science Education (BOSE) at the National Academies of Sciences, Engineering, and Medicine (NASEM). The purpose of CASTL-K12 is to serve as a unique coordinating body that brings together a diverse group of science education stakeholders at both the national and state levels, to develop and promote evidence-based policies and practices for effectively implementing and supporting effective science teaching that serves all students. NASEM and BOSE staff are bringing these groups together to facilitate partnerships and joint action for identifying, designing, planning, enacting, and documenting short-term "actions" aimed at improving the implementation of science standards. It is anticipated that the tools designed by the CASTL-K12 membership will serve as a resource for improving science education across the United States. Thus far, Dr. Hughes has attended multiple sessions and worked with a team at FSU to develop support for science teachers locally. She was also invited by the American Physical Society to submit graduate student mentoring best practices for the APS' Effective Practices for Physics Programs.

Inclusive Excellence in CIRL Education Programs

Diversity and inclusion are focal points of all MagLab educational and outreach activities. **Table 3.1.1** highlights the number of participants for CIRL's programs (i.e., one week or longer).

Table 3.1.1. *Participants of Education Programs*

2025	Total
Research Experiences for Undergraduates (REU) summer	16 undergraduates
Magnetic Momentum Scholars Program	10 undergraduates
Research Experiences for Teachers (RET) summer	10 K-12 teachers

2025	Total
High School Externship (2024-2025 Academic Year)	17 high school students
MagLab High School Summer Scholars Program	7 high school students
Camp TESLA (Two 1-week camps)	44 middle school students

WEB-BASED OUTREACH

Magnet Academy

The Magnet Academy is MagLab's web-based home for free resources on magnetism and electricity for educators and learners of all ages. Magnet Academy resources include lesson plans, recorded science demonstrations, and interactive activities for teachers, students, and parents. **Table 3.1.2** shows the Google analytics for 2025.

Table 3.1.2. *Pageviews for Magnet Academy in 2025*

Page Title	Page Views[1]	Active Users[2]	Avg Number of Views per User	Event Count[3]
Total Magnet Academy Views	582,425 +.94%	327,856	1.59	2,342,277 +0.61%
Watch and Play	189,131 -3.42%	93,482	2.07	736,495 -2.75%

K-12 EDUCATION PROGRAMS

MagLab Field Trips

CIRL brings 5th – 12th grade school groups to the MagLab for educational field trips that include a tour of the MagLab's Tallahassee location led by a MagLab scientist or engineer, along with a hands-on activity facilitated by CIRL's K-12 Education Director, Carlos Villa. The goal of these field trips is to expose students to MagLab related science and engineering activities and tell them about the research that occurs here. (**Figure 3.1.1**). The full description of the hands-on activities offered can be found on the MagLab's website: https://nationalmaglab.org/education/teachers/. For the 2024-2025 school year, field trips were advertised through an email sent to all local school administrators, the MagLab Educators Club (a mailing list of over 570 educators and parents), and through regional and national organizations such as the Big Bend/Leon Association for Science Teaching, the Florida Association of Science Teachers, and the National Science Teaching Association.

Figure 3.1.1*. Students learn about circuits during a field trip to the MagLab.*

During the 2024–25 school year, Carlos Villa provided outreach to 2,012 students across 45 schools, with the majority being fifth graders (47%), followed by seventh, eleventh, and twelfth graders (22%). Field trip requests came from Florida and Georgia, with the most popular activities being *Build an Electromagnet: Turn Magnets On & Off*, accounting for 47% of requests. In alignment with CIRL's goal to broaden participation, 75% of the school groups served were from Title I schools, ensuring access to innovative scientific resources for students from low-income communities.

Metrics for Success. After each field trip, teachers were sent a short online survey asking them about their experience. Overall, the teachers were very satisfied with their experience. 100% (n=38) of teachers would participate in a MagLab field trip again, and 100% (n=38) rated the overall experience as excellent or very good. 100% of teachers said that the details given in the email notification of official outreach were

[1] Views of web pages including repeat views by the same user.
[2] Unique users who engaged with the site.
[3] The event count shows a specific interaction or occurrence on the website (e.g., views, clicks, downloads), highlighting how often a user interacts with specific elements on the website within a given time span.

sufficient for planning purposes and that the website provided them with enough information to appropriately select an activity and incorporate it into their class. **Table 3.1.3** presents average satisfaction scores (i.e., 5 rating = the highest) for the quality of the instruction that Villa provided. The high ratings show that the outreach experiences were well received by the educators.

Table 3.1.3. *Teacher Ratings of Classroom Outreach*

Question (n=20)	Mean Response
During the hands-on activity, the outreach educator employed instructional strategies that made the content/concept(s)understandable to my students.	4.89
During the hands-on activity, the outreach educator made connections between the content/concept(s) presented and the real-world.	4.84
During the hands-on activity, students were encouraged to ask scientific questions to shape their understandings.	4.87
The hands-on activity was developmentally appropriate for my students.	4.95
The hands-on activity aligned with relevant state/national standards.	4.71
I learned more about the MagLab during this fieldtrip.	4.84

(5 pt. Likert scale 5=Strongly Agree, 1=Strongly Disagree)

Lessons Learned. The MagLab's field trip program continues to receive excellent ratings from teachers, with tours and hands-on activities praised for engaging students and meeting the goal of introducing them to MagLab science and engineering. To further enhance the experience for the 2025–2026 school year, Villa plans to add more interactive experiences for the students.

Gainesville

The MagLab facilities at the University of Florida conduct their own educational programs, which are currently facilitated by Eli Wolf and Nicolas Silva. During the 2025 calendar year, staff from the AMRIS and High B/T MagLab facilities gave 17 tours of the facility to 276 people. These tours included K-12 students, graduate and undergraduate students, visiting scientists, and community members. By tabling at events and conducting presentations, AMRIS and High B/T staff were able to reach an additional 412 researchers, K-12 students, and members of the general public were reached through presentations and tabling at events. MagLab staff at UF also hosted and coordinated SEMRC, a conference attended by 120 scientists, a majority of whom were undergraduate or graduate students.

Los Alamos

In 2025, LANL Pulse Field Facility members participated in the 9th annual Los Alamos National Laboratory Summer Physics Camp. The free camp for about 30 middle and high school students from across New Mexico and Hawaii aims to empower students to consider careers in science, technology, engineering, and math (STEM). Activities included coding Arduino boards and hands-on exploration in optics, chemistry, computer science, and astrophysics. Our staff, comprising scientists, technicians, postdocs, and students — Km Rubi, Shalese Lovell, Danielle Yvonne, Stefan Marinkovic, Tim Noe, Chris Mizzi and Boris Maiorov — were instrumental in developing and showcasing hands-on magnet-related demonstrations. Students were also given a tour of the PFF facility at LANL. Additionally, throughout the year many of the scientists at the PFF gave talks about high field research at universities all over the country.

MagLab *Camp Tesla (Technology, Engineering, and Science in a Laboratory Atmosphere)*

In the summer of 2025, the MagLab hosted two sessions of our Camp TESLA, a co-ed camp that runs for one week. Campers attended the MagLab Monday through Friday, from 9 a.m. to 4 p.m., engaging with scientists across the lab to learn about their research, career paths, education, and even personal interests. This camp was designed to immerse participants in MagLab-related science while introducing them to STEM careers and role models connected to the lab. The camps successfully met these goals by featuring presentations and hands-on activities led by MagLab professionals, including five faculty/postdocs, one staff member, five graduate/undergraduate students, and one MagLab REU. Each activity was aligned with the presenter's area of expertise, giving campers a deeper understanding of real-world STEM applications. The week concluded with a celebratory reception where campers showcased their projects to their families.

44 students participated in Camp TESLA in 2025 **(Figures 3.1.2).** The three highest-rated activities were: (1) the liquid nitrogen demo showing the impacts of lower temperatures on materials and superconductors, and concluded with the creation of liquid nitrogen slushies for all to enjoy; (2) the electrophysiology activity where campers explored the relationship between electricity and the human body by using their own body to move a motor in a machine; and (3) the building of electromagnets where the campers built their own electromagnets using concepts of electricity and magnetism.

Figures 3.1.2. *The 2025 Summer Camp TESLA groups.*

Metrics for Success: To assess how successful the camps were at achieving their goals, willing campers completed a pre- and post-program survey. To assess the impact of the camp on "doing science", we used a survey instrument that measured STEM self-efficacy along with survey questions asking them to rate the activities that they participated in. To measure whether we created a safe space for the youth, we used a sense of belonging within STEM survey and a survey that measures attitudes toward making mistakes. To assess goal 2, how well we introduced youth to careers and role models in STEM, we used surveys that measured the relevance of STEM and asked them to rate the tours and role model activities to help us determine ways to improve the program. Connecting these concepts of doing science and meeting role models and learning about their career paths has been linked to STEM identity development. **Tables 3.1.4-3.1.6** show that both camps achieved their goals by giving campers a space to do science and introducing them to role models who were working in STEM. The tables highlight that 100% of the campers **learned** about new STEM disciplines and STEM careers they had not heard of before. Furthermore, 100% of the campers said that they felt they were a part of the camp, that camp teachers made them feel wanted and accepted, and that they felt accepted by their peers at camp, thereby demonstrating that the camps are creating a safe space for participants to practice their science skills and learn about STEM careers. The tables referenced in this section are part of a comprehensive report that is available upon request. The information presented here highlights key results from that full report to provide a concise overview. The full report is available upon request. (Note: all programs listed in the annual report undergo their own internal evaluation, resulting in a comprehensive report. Each section provides highlights from these reports to save space in the MagLab annual report. CIRL can provide any or all reports at the reader's request.)

Table 3.1.4. *Participants self-reported learning about careers.*

During Camp…	Percent (n=40)
Did you learn about new STEM disciplines and fields?	100%
Did you learn about STEM careers you had not heard of before?	100%
Did you learn more about how to achieve a career in STEM?	80%

Table 3.1.5. *Participant connections to STEM role models.*

During Camp…	Percent (n=40)
Did you meet any STEM role models?	82%
Did you meet someone who taught you more about what it is like to work in science?	95%

** For this item, n=41*

Table 3.1.6. *Sense of Belonging in Camp*

During Camp…	Percent (n=40)
I was able to learn from any mistakes I made during camp.	100%

During Camp…	Percent (n=40)
I was a part of the camp.	100%
The camp teachers made me feel wanted and accepted.	100%
I was accepted by my peers at camp.	100%

Lessons Learned. Camp TESLA 2025 was highly successful, with 93% of campers rating their experience as above average or outstanding and none rating it below average. The program effectively met its goals by offering engaging, hands-on STEM activities and meaningful interactions with STEM professionals, which increased students' interest in science and fostered a strong sense of belonging and STEM identity. Campers reported learning about new STEM careers and disciplines, and many met role models who helped them understand what working in science is like. Improvements from the previous year included more interactive tours and activities that encouraged curiosity and experimentation. Looking ahead to Camp TESLA 2026, planned enhancements include more interactive tours, expanded DNA activities with historical and technical context, and upgraded engineering challenges. Role model engagement will also be increased through bios and a "Wall of Role Models" created by campers.

High School Externship

The MagLab High School Externship program aims to provide local high school students with real-world STEM experience by pairing them with MagLab scientists for a research project that lasts the academic year. Carlos Villa collaborated with local Tallahassee high schools to recruit 17 students. Recruitment was done through communications with the school counselors, through emails to alumni of MagLab K-12 programs, and through the MagLab website. Each student was matched with a mentor at the MagLab. Throughout the program, students engaged with research teams and STEM professionals, gaining insight into scientific careers. The externship culminated in an in-person poster session where participants showcased their work to family, friends, and MagLab staff **(Figure 3.1.6).** A detailed list of students, mentors, and research topics is available in **Table 3.1.7.**

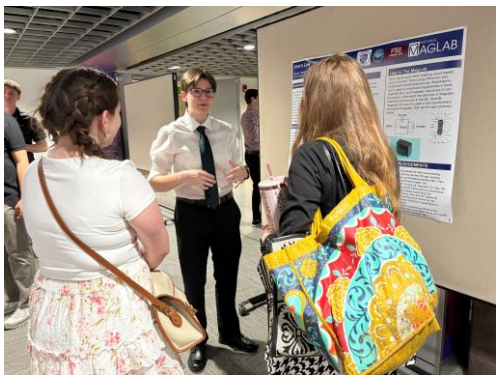

Figure 3.1.6. *A MagLab Extern explains her work during the High School Externship poster session.*

Table 3.1.7. *High School Externship 2024-25*

Student	Mentors (MagLab Department)	Research Subject
Himank Chhaya	Kaya Wei (CMS)	Investigating Thermoelectric Properties of $YbIr_2(Cu,Ga)_xZn_{20-x}$
Sadler Clifford	William Scott Marshall (MST)	Quench Heaters for Double-Pancake Modules: Purpose, Design, and Tests
Gabriella Dattoli	Muhammad Garba (RECMIB)	Ohm's Law
David Davis	Daniel Davis (ASC)	Fuzzy Logic in the Control of Humidity in Furnace Implementation
Siri Davidi	William Oates (CMS)	Investigating Entanglement and Superposition for Enhanced Computational Models
Benjamin Hill	Theo Seigrist (CMS)	Development of custom, low-cost, high-precision 3D-printed sample holders and labware for scientific applications
Kaylee Jeon	Kwangmin Kim (MST)	Test of Multi-Width No-Insulation Magnet at 77 K
Karan Komuroji	Hitesh Changlani (CMS)	Statistical Simulation of Electron Activity
Veronika Kulichenko	Vadym Kulichenko (CMS)	Crystal Growth of LnBiTe Phases by Flux Metho
Jesse Nathan	Vince Toploski (MST)	Mechanical and Energy Absorption Properties of Protective Headgear

Student	Mentors (MagLab Department)	Research Subject
Victor Shumnyk	Alexey Suslov (CMS)	Literature Review Optimization Using AI
Vaneesha Sinha	Kaya Wei (CMS)	Investigation of Sm0.5Mn3Ge3 Crystals' Thermoelectric Properties
Daria Sulihan	Jan Jaroszynski (CMS)	Electric Transport in Different Materials
Alexander Wang	Eric Clark (WAG)	QuantEval: Automated Quantitative Evaluation of NSF Proposals

Metrics for Success. To evaluate the effectiveness of the High School Externship program, willing participants completed a pre- and post-program survey. Results showed strong outcomes: 100% of respondents said they would recommend the program to a friend. On the post-survey, participants were asked about their career aspirations and all but one student indicated an interest in a STEM career. The exception was a student who expressed an interest in a film career and partnered with the MagLab's videographer for the program. All participants also found the program's instructions helpful and felt their personal goals were met. **Table 3.1.8** presents the average survey responses, further supporting that the program successfully provided meaningful, real-world STEM experiences aligned with its objectives.

***Table 3.1.8**. Benefits of participating in the externship program.*

My participation in externship…	Pre-Survey Mean (n=20)	Post-Survey Mean (n=20)	Change
Led me to a better understanding of the skills needed for my career goals.	3.25	3.83	+0.58
Increased my understanding of science career options.	3.00	3.75	+0.75
Helped me engage in real-world science research	3.00	3.75	+0.75
Increased my confidence to try out new ideas or procedures on my own	3.25	3.67	+0.42
Helped me to feel responsible for a project	3.30	3.67	+0.37
Increased my interactions with scientists	3.25	3.83	+0.58

(4 pt. Likert scale 4=Strongly Agree, 1=Strongly Disagree)

Lessons Learned. The MagLab's High School Externship program continues to be rated highly, with student feedback confirming that the program successfully meets its goal of providing real-world STEM career experiences. Participants reported increased understanding of science, greater confidence in engaging with scientific activities, and unanimously stated they would recommend the program to a friend. Valuable feedback from both externs and mentors has guided several planned improvements for the 2025–2026 academic year. These include clearer onboarding expectations for students, recorded orientation sessions, and monthly mentor check-ins. The program manager will also explore software licensing options to better support tech-based projects. Mentor onboarding will emphasize flexible scheduling and discourage mentoring one's own child to maintain professional boundaries. Mentors will be encouraged to assess students' knowledge early on to tailor projects effectively and will be given more opportunities to share feedback and communicate directly with Carlos Villa to address any issues. These updates aim to enhance the experience for all participants and ensure continued program success.

High School Science Scholars Program

The High School Science Scholars Program is a partnership with Godby High School, a local Title I school in Tallahassee. In summer 2025, the MagLab hosted seven Godby students in this three-week program designed to help students from low-income families see their potential to participate in scientific research **(Figure 3.1.7)**. During the three weeks, participants come to the MagLab Monday through Thursday for seven hours each day, where they engage in hands-on activities, facility tours, and presentations from MagLab scientists who serve as STEM

***Figure 3.1.7.** The 2025 Science Scholars.*

role models. The program concludes with students presenting research proposals to MagLab scientists, opening the door for potential future research collaborations and participation in the MagLab High School Externship.

Metrics for Success. The High School Science Scholars program at the MagLab successfully met its primary goals of introducing students to research and careers in materials science and developing their STEM skills. Participants reported a deeper understanding of STEM career paths, as evidenced by 86% reporting that they were very interested in a STEM career after the program compared to only 14% on the pre-survey. Additionally, all respondents strongly agreed that they gained new STEM skills during the program and believed these skills would support their future career paths. Survey data showed growth across all eight measured STEM skill areas, with the most significant improvements in students' ability to interact with scientists, feel like scientists, and explain their projects to others—demonstrating the program's effectiveness in fostering both interest and competency in STEM. **Table 3.1.9** shows that the means for all the measured STEM skills increased, providing evidence that the program increased the students' STEM skills, thereby meeting the goals of the program.

Table 3.1.9. *Godby Science Scholars STEM Skills.*

How would you rate your ability to…	Pre-survey Mean (n=7)	Post-survey Mean (n=7)	Change
Explain my project to others	3.43	4.43	+1.00
Feel like a scientist	3.00	4.00	+1.00
Interact with scientists	3.14	4.29	+1.15
Prepare a scientific poster	3.29	4.14	+0.85
Formulate a research question that could be answered with data	3.50	4.14	+0.64

(5 pt. Likert scale 5=Strongly Agree, 1=Strongly Disagree)

Lessons Learned. The Science Scholars program received overwhelmingly positive feedback, with all participants reporting valuable insights into STEM research and career opportunities at the MagLab and a deeper understanding of the skills used by MagLab staff. Key improvements, such as coaching scientists to share personal and professional details, allowing more time for poster development, and starting daily activities 30 minutes after arrival, enhanced student engagement. Evaluation results also identified areas for growth, including helping students feel part of the scientific community and improving collaboration. To address these, Mr. Villa will work with teachers to incorporate team-based challenges and encourage student-led idea sharing during poster development.

Teachers And Informal STEM Educators

CIRL supports K–12 teachers and informal STEM educators through parent and educator workshops and the annual Research Experiences for Teachers (RET) program. These workshops, designed by Carlos Villa, introduce educators to MagLab-specific STEM topics that can be integrated into classroom instruction. Each session aligns with state and national education standards and engages participants in inquiry-based, hands-on science activities connected to MagLab research, ensuring teachers leave with practical strategies to inspire their students. **Table 3.1.10** highlights the workshops offered in 2025.

Table 3.1.10. *Educator and Parent Workshops offered by CIRL*

Date	Presentation Group	Presentation Title
1/28	Woodville Elementary PLC (Professional Learning Community)	Science Fair
5/29	Leon County Schools	MagLab Summer Camp Activities at 21st Century Sites
7/8	Panhandle Aera Educational Consortium (PAEC)	Empowering Teachers to Ignite Scientific Exploration (5th Grade)
7/9	Panhandle Aera Educational Consortium (PAEC)	Empowering Teachers to Ignite Scientific Exploration (8th Grade)
10/24	Florida Association of Science Teachers	Florida's Tesla Tales

Research Experiences for Teachers (RET) Program

Figure 3.1.8. *The 2025 RET Cohort*

The Research Experience for Teachers (RET) program is designed to help educators integrate MagLab science into their STEM lessons and develop MagLab-focused lesson plans. It begins with a one-week, in-person experience at the MagLab featuring facility tours (ASC, ICR, NMR, MST, CMS, RECMIB, and DC Field) and presentations by MagLab scientists. This is followed by monthly virtual meetings in the fall, where Carlos Villa provides pedagogical support as teachers create lesson plans to be published on the MagLab website. Each teacher is paired with a MagLab scientist who serves as a consultant throughout the process. For 2025, 71 educators applied, and 10 were selected, representing elementary, middle, and high schools across five states (Arizona, Florida, North Carolina, Texas, and Virginia), all from Title I schools **(Figure 3.1.8, Table 3.1.11)**. The completed lesson plans are publicly available on the RET webpage: https://nationalmaglab.org/education/teachers/ret/

Table 3.1.11. *2025 RET Participants*

RET Participant (School, State)	MagLab Mentor	Lesson Plan Title
Jacqueline Bromley (Pasco High School, FL)	Wei Guo & Mikai Hulse (MST)	Superconductors and Where to Find Them
Emily Capote (Sabal Palm Elementary School, FL)	Scott Marshall (MST)	Understanding the Relationship Between Energy and Motion Using Experiments and the Engineering Design Process
Tiffany Dial (Hoke County Schools, NC)	Steve McGill (CMS)	Can Magnetic Field Disrupt Seed Growth in Fast Plants?
Octavio Fernandez (Shenandoah Middle School, FL)	Lissa Anderson (ICR)	Protein Builders: The Central Dogma
Jennifer Hanson (University High School, TX)	Dan Davis (ASC)	Ampere's Law Exploration
Kisha Jarret (Griffin Middle School, FL)	Kaya Wei (CMS)	Magnetic Mysteries: Creating Magnetic Crystals
Jaida Laramore (FAMU DRS, FL)	Cyprian Lewandowski (CMS)	Electrifying Fields: Exploring Superconductivity and Magnetic Forces
Angelique Martinez (Pembroke Middle School, VA)	Malathy Elumalai (NMR)	Exploring Matter: Understanding Solids, Liquids, and Gasses Through the Eyes of Military Children
Leslie Oberry (Taylor County Elementary School, FL)	Munir Humayun (RECMIB)	Earth Meets Outer Space: Meteorites
Andre Pineda (Canyon Day Jr High School, AZ)	Alexey Suslov (CMS)	Crystal Clash: Battle of the Lattices

Metrics for Success. Evaluation of the RET program included three surveys: a pre-survey before the program began, a mid-point survey at the end of the in-person week, and a post-survey following the teachers' lesson plan presentations in November. To measure the program's impact on connecting MagLab science to classroom instruction, the mid- and post-surveys asked teachers to rate changes in their interest in STEM research, their understanding of scientific concepts, and their ability to incorporate research into teaching (see **Table 3.1.12 and Table 3.1.13**). Results showed unanimous agreement that the RET program increased both their understanding and interest in MagLab research. Teachers also strongly agreed that the program enhanced their ability to apply research to STEM teaching, stimulated reflection on improving practice, and boosted confidence in guiding students through open-ended experiments. In addition, participants reported greater confidence in providing examples of current STEM research during instruction. Overall, the data demonstrates that the RET program significantly strengthened teachers' knowledge, confidence, and instructional practices, with both in-person and virtual sessions contributing to sustained engagement and effective application of MagLab science in the classroom.

Table 3.1.12. *Participant Reported Impacts of the RET Program*

The RET Program… (N=10)	Mid-point Mean	Post-survey Mean
The RET program increased my understanding of research at the MagLab.	4.00	4.00
The RET program increased my interest in the research at the MagLab.	4.00	4.00
The RET program Increased my understanding of the ways that MagLab research can be applied to my STEM teaching.	3.80	4.00
The RET program Increased my interest in the ways that MagLab research can be applied to my STEM teaching.	3.80	4.00
This portion of the RET program stimulated me to think about ways I can improve my teaching.	3.80	4.00

(4 pt. Likert scale 4=Strongly Agree, 1=Strongly Disagree)

Table 3.1.13. *Attitudes Towards Science Teaching*

After participating in this portion of the RET program… (N=10)	Pre-survey Mean	Mid-point Mean	Post-survey Mean
I understand STEM concepts well enough to be an effective STEM teacher.	3.10	3.60	3.90
I am confident in my ability to guide students through open-ended science experiments.	2.80	3.80	3.80
I often provide examples of current STEM research into my STEM teaching.	2.60	-	3.70
When a student has difficulty understanding a STEM concept, I feel confident that I can help them understand it better.	2.90	3.67	3.70
When teaching STEM, I will usually welcome student questions.	3.30	3.80	3.90

(4 pt. Likert scale 4=Strongly Agree, 1=Strongly Disagree)

To evaluate how well the program supported teachers in developing their MagLab-focused lessons, the post-survey asked teachers to rate the level of support they received (see **Table 3.1.14**). The results show that the program successfully met its objectives by helping educators integrate MagLab STEM research into their classroom instruction.

Table 3.1.14. Support on Lesson Plan Development

How satisfied are you with the following elements of the RET program? (Post-survey) (N=10)	Mean	Percent Satisfied
The support I received from the overall group of RET participants in developing a lesson plan.	3.80	100%
The support of my MagLab scientist mentor in developing my lesson plan.	3.60	90%

(4 pt. Likert scale 4=Strongly Agree, 1=Strongly Disagree)

Lessons Learned. Overall, the program received very high ratings, with participant feedback confirming that its goals are being met. All teachers reported gaining valuable knowledge about MagLab science and feeling well supported as they developed their MagLab-focused lesson plans. Building on insights from the 2025 survey, Carlos Villa plans to increase the interactions with the teachers and scientists by including scheduled check-ins for teachers with their mentors. A dedicated time slot on the last day of the in-person week will be created to assist teachers in connecting the MagLab research to classroom ready lessons.

UNDERGRADUATE STUDENTS

Undergraduate students are at a crucial stage in the STEM workforce trajectory, during which they are developing research skills in specific STEM fields. The MagLab offers two undergraduate programs that are facilitated by CIRL's Mentoring Director, Kawana Johnson: (1) the Magnetic Momentum Scholars Program and (2) the Research Experiences for Undergraduates (REU) Program.

Magnetic Momentum Scholars Program. The Magnetic Momentum Scholars (MMS) program is a partnership with Florida Agricultural and Mechanical University (FAMU). The goal of the MMS program is to expose FAMU students to STEM careers at the MagLab through tours and professional development sessions. For four weeks during the Spring 2025 semester, the MagLab hosted a cohort of 10 FAMU undergraduates in the MMS program. Students received a $1000 stipend as a form of participant support. Fifty-eight FAMU students applied and 10 were accepted. Students were selected based on the following criteria: statement of interest included on the application and individual interviews conducted by the program director. **(Figure 3.1.9).**

Figure 3.1.9. *Spring 2025 Momentum Scholars*

The 10 participants represented the following undergraduate stages: 50% sophomores, 30% juniors, and 20% seniors and majors: 10% biological sciences, 50% engineering disciplines, 20% computer science, 10% agricultural science, and 10% food science. Dr. Johnson planned professional development sessions that were held each week. These sessions included panels by MagLab graduate students, postdocs, and faculty. These sessions allowed the students to gain professional advice and learn about various career paths in STEM. In addition, a group of MagLab faculty provided the students with weekly tours of the various departments and research areas within the lab to inform them of potential research opportunities. The program culminated with a focus group and appreciation lunch. A list of the Magnetic Momentum Scholars, majors, and classifications can be found in **Table 3.1.15.**

Table 3.1.15. *2025 Magnetic Momentum Scholars*

First Name	Last Name	Major	Classification
Ronnie	Burns	Computer Science	Senior
Riqyra	Cauthen	Industrial Engineering	Sophomore
Leah	DuBose	Biomedical Engineering Astrophysics	Sophomore
Zoe	Fleurinord	Biomedical Engineering	Junior
Ryan	Goodson	Electrical Engineering	Sophomore
Ryan	Henry	Biological Systems Engineering	Junior
Jordan	Monts	Computer Science	Sophomore
Mariyah	Moore	Agricultural Science and Biology Premed	Junior
Dorien	Nixon	Biology	Sophomore
Nana Ama	Nsiah Ababio	Food Science	Senior

Metrics for Success. To assess whether the program is meeting its goal of exposing FAMU students to STEM careers at the MagLab, Johnson gives students a pre- and post-program survey and reaches out to speakers and tour guides through a post-program survey. For the students, only one participant had some knowledge of careers in STEM research prior to the start of the program. By the end of the program, 100% of participants said they had a substantial or fair amount of knowledge about careers in STEM research. 100% of respondents reported that they met scientific researchers, connected with potential STEM mentors, and peers interested in STEM research. 100% of participants also reported that they were able to explore whether STEM graduate school or a STEM research career may be the right path for them to pursue. In addition, 100% of participants said they felt comfortable following up with any of the professionals they met during the program. The pre/post survey also helped to demonstrate the type of careers students were interested in pursuing. **Table 3.1.16** highlights their career interest prior to and after the program. Overall, 100% of participants said they were satisfied or very satisfied with their program experience.

Table 3.1.16 *Participant Career Interest*

What type of career are you interested in pursuing?	Pre-Program Percent (n=10)	Pre-Program Count	Post-Program Percent (n=9)	Post-Program Count
Medical Career (e.g. MD, Physical Therapy, Nursing)	20%	2	33%	3
Biological Science Career	10%	1	22%	2
Engineering or Computer Science Career	60%	6	44%	4
Other *(e.g. Plant Biology)*	10%	1	0%	0

MagLab professionals were asked to participate as speakers and tour guides during this 4-week program. When asked to rate their degree of satisfaction with the program, 100% of responding participants (n=9) were satisfied. 100% of participants were somewhat or extremely satisfied with the amount/level of communication provided by the program manager *(e.g. expectations/timeliness).* After the program ended, 4 scholars were selected by mentors they met at the MagLab to continue as interns for an additional 5 weeks. When asked if they worked well together with their mentee, 67% of responding mentors (n=3) agreed or strongly agreed. To assess the quality of mentoring, we asked mentors to tell us what strategies they used to ensure the students understood their expectations. The most cited strategies for a successful relationship were discussing expectations for the mentee at the beginning of the program (n=3), encouraging the mentee to ask questions (n=3), and talking to my mentee about future career plans and providing advice (n=3). The full list of strategies can be found in **Table 3.1.17.** We plan to continue presenting this information to mentors who volunteer for future programs so that they can see what types of strategies are most useful.

Table 3.1.17 *Mentoring Strategies Utilized by Mentors*

What mentoring strategies did you utilize with your mentee(s)?	Percent (n=3)
Discussing expectations for the mentee at the beginning of the program	100%
Encouraging the mentee to ask questions	100%
Talking to my mentee about future career plans and providing advice	100%
Pre-program meeting to answer questions.	67%
Having mentee attend research meetings	67%
Giving my mentee multiple opportunities to engage in research activities	67%
Introducing mentee to other members of research team	67%
Providing background reading material before the program	33%
Having regular communication and/or check-ins throughout the program to make sure the mentee understands the project	33%

Lessons Learned. Overall, the program was a success as 100% of the students reported that they learned more about research at the MagLab, met scientific researchers, and connected with potential STEM mentors. Feedback indicated that tours, professional development sessions, and mentoring opportunities worked particularly well for the participants' experience. However, based on feedback concerning programmatic elements, students would like to have more interactive experiences like tours as opposed to panel discussions. The program manager will attempt to incorporate more tour opportunities into the program without eliminating the opportunity for professional development discussions. This will, hopefully, allow for a renewed focus on making connections and gaining more interactive experiences with peers and professionals. To ensure continued quality in participants, the program manager will continue to incorporate an interview process for potential candidates that will begin shortly after the application deadline.

Research Experiences for Undergraduates (REU)

The MagLab's REU program invites undergraduates from across the country to participate in a 10-week research experience, aimed at providing participants with opportunities to learn research skills and explore MagLab-related research career options. The REU program also allows MagLab scientists and engineers to develop their mentoring skills. To recruit students, Johnson posted information about the program on multiple sites (e.g., Handshake, Simplicity, multi-school listings via job management boards, Pathways to Science); sent details to deans and department chairs throughout the country as well as with REU alumni to share within their networks, and solicited assistance from MagLab faculty and staff in promoting the opportunity to students and colleagues within their spheres of influence. The MagLab REU program had 112 applicants. Based on students' responses to the application, most of the selected students heard about the program from a MagLab employee (31.2%), a friend/professor/advisor (31.2%), or the MagLab website (18.7%). The selection process relies on mentors to review the applications and send Johnson their top three choices. These choices are based on students' experience and

Figure 3.1.10. *Summer 2025 REU Participants*

interest in the mentor's respective research area or discipline. Johnson then finalized this list, accepting 16 participants from the mentor's top choices (**Figure 3.1.10**).

The 16 REU participants were divided across all undergraduate stages: 6% freshmen, 31% sophomores, 37.5% juniors, and 25% seniors. The participants represented a variety of majors: 6.25% engineering *(e.g. Biomedical-1),* and 87.5% physical science *(e.g. Physics-6, Chemistry-5, Biochemistry-1, Material Science-2),* and 6.25% Information, Communication & Technology-1.

Dr. Johnson planned professional development sessions that were held once a week to help students gain a broader understanding of various types of STEM careers**.** These sessions included: panels by MagLab research faculty, tenure-track faculty, graduate students, as well as MagLab alumni who are STEM entrepreneurs or industry professionals. Sessions also included information on graduate school applications and developing an elevator pitch. Each week, beginning in week 6, REUs led tours of their labs for the rest of the group **(Figure 3.1.11)**. The program culminated in a 3-minute pitch presentation wherein the students described their research project in three minutes or less. MagLab faculty and staff were invited to serve as judges to provide participants with feedback and recognize the top three presenters. A list of the REU participants, their respective universities/colleges, research topics, and mentors can be found in **Table 3.1.18.**

Figure 3.1.11. *REU Student During a Lab Tour*

First Name	Last Name	School	Research Area	Mentor(s)	Department
Emma	Campbell	Florida State University	Forever Chemical Identification Using ^{19}F Liquid Dynamic Nuclear Polarization	Thierry Dubroca	NMR
Anne	Carmichael	University of Wisconsin-Eau Claire	Ceramic Fiber Prevents Sagging in Superconducting Coils During Heat Treatment	Eric Hellstrom & Shaon Barua (co-mentor)	ASC
Darby	Hanes	Texas Tech University	Multiscale Rheology of Soft Biological Materials	Jamel Ali	CMS
Carly	Hill	Juniata College	Investigating ultrasound-assisted fractionation method to determine more efficient bio-oils	Martha Chacon	ICR
Megan	Joyce	Washington & Jefferson College	Molecular LEGOs for Medicine: Stacking, Stabilizing, and Solving with Solid-State NMR	Robert Schurko	NMR/CIMAR
Hayden	Kinstler	University of Wisconsin-Eau Claire	Wide performance variation of REBCO coated conductors	Aixia Xu	ASC
Julia	Martin	Florida State University	Development of Cost-Effective RF Shields for 21.1T MRI Probes	Malathy Elumalai	NMR/CIMAR
Naoum	Mashraqi	Florida State University	A Measurement Scheme for Low Frequency Shot Noise Spectroscopy	Laura Greene	Admin/Physics
Mason	McFarland	Gettysburg College	Synthesis and Characterization of Potential Superconductive Materials	Shermane Benjamin	DC Field CMS
Adam	Mooers	Florida State University	Long Wavelength Electrodynamics of Transition Metal Oxides	Guangxin Ni	CMS
Kiera	Powers	Florida State University	Assessing Cooling Efficiency with a NMR Thermometer	Tomas Orlando	EMR
Lily	Schroeder	Smith College	Using Cantilever Resonance to Measure Low Temperatures in Field	Ali Bangura	DC Field CMS

First Name	Last Name	School	Research Area	Mentor(s)	Department
Noelle	Simmons	Rowan University	Electron Based Dissociation of Fluorescently Derivatized Glycans using Fourier Transform Ion Cyclotron Resonance Mass Spectrometry	Kristina Hakansson	ICR and FSU Chemistry & Biochemistry
Charlotte	Snow	University of Denver	Site-Selective Substitution in RT_2Zn_{20}: Effects of *R*-, *T*-, and Dual-Site Disorder	Kaya Wei	DC Field CMS
Julia	Sveen	Florida State University	Power Supply Failure Detection using Machine Learning Models	Julia Smith & Abigail Centers (co-mentor)	DC Field CMS
Keen	Zhang	University of Florida	Studying the Effects of Different Membrane Scaffold Proteins on GPCR Functionality in Lipid Nanodiscs	Matthew Eddy (UF)	AMRIS UF/Chemistry

Metrics for Success. Our pre-/post-survey of all participants helped us assess the success of the program. In terms of research skill development, we used a modified version of the undergraduate research student's self-assessment (URSSA) survey instrument (Weston & Laursen, 2015[4]). Although this survey has historically been administered post-program by other REU programs, we were able to incorporate a pre-survey to measure actual changes in skills rather than retrospective self-reported changes. **Table 3.1.19** highlights the mean changes from pre- to post-program related to skill development, demonstrating the success of the program. In addition, all participants indicated that the experience increased their positive perception of STEM careers or reaffirmed their already positive perception of STEM careers. Ninety-four percent of the REU students rated their mentor as above average or outstanding.

Table 3.1.19. *Changes in REU Skill Development*

How would you rate your ability to…	Pre-Program Mean (n=16)	Post-Program Mean (n=16)
Feel comfortable in working collaboratively with others	4.19	4.56
Work independently	4.19	4.31
Problem-solving in general	4.06	4.06
Understand what everyday research work is like	3.56	4.50
Explain my projects to people outside my field	3.50	3.75
Understand the relevance of research to my coursework	3.63	3.88
Manage my time	3.81	3.88
Engage in real-world science research	3.13	4.38
Try out new ideas or procedures on your own	3.19	3.94
Interact with scientists from outside your school	3.56	4.38
Feel a part of a scientific community	3.44	4.31
Make oral presentations	3.50	3.69

To measure mentoring quality, we reviewed the categories of quality mentoring developed by the Center for the Improvement of Mentored Experiences in Research (CIMER) to determine which were most relevant to undergraduate mentees in the 10-week program. Three best practices for mentoring developed by CIMER are aligning expectations, assessing understanding, and maintaining effective communication. Our surveys to REUs and mentors focused on these practices to assess whether they were being utilized in the program. We asked REUs to rate their mentors and to tell us the effective strategies that their mentors used throughout the program. We also asked mentors to tell us what strategies they used to ensure the REU understood their expectations and completed their projects. 94% of REU participants said they worked well together with their mentor and 88% said their mentor was available when they needed them during the program.

[4] Weston, T. J., & Laursen, S. L. (2015). The undergraduate research student self-assessment (URSSA): Validation for use in program evaluation. *CBE—Life Sciences Education*, *14*(3), ar33.

By asking both mentees and mentors to describe quality mentoring strategies, we were able to determine: (1) what strategies were rated most impactful by REUs and (2) whether mentors were using these best practices. The most impactful mentoring strategies were sharing knowledge and insight and frequent meetings. The full list of strategies can be found in **Table 3.1.20.** We plan to present this information to mentors who volunteer for future programs so that they can see what types of strategies are most admired by undergraduates.

Table 3.1.20. *Quality Mentoring Themes Triangulated by REU Students and Mentors*

REU students	REU Mentors
Students were asked what strategies their mentor(s) used to **check for understanding.** The themes from their responses were: • Encouraging mentee to ask questions (n=13) • Introducing mentee to other members of the research team (n=13) • Having regular communication and/or check-ins throughout the program (n=11) • Having mentee attend research meetings (n=11)	REU mentors were asked how they **checked for understanding** when communicating expectations to REU students. They indicated that they used the following strategies: • Asking questions and engaging in discussion (n=10) • Frequent meetings (n=10)
REU participants were also asked about the overall **mentoring strategies** that mentors used that they found **particularly impactful**. The strategies identified were: • Sharing knowledge and insight (n=15) • Frequent meetings (n=12) • Constructive criticism (n=12)	Mentors were asked what **mentoring strategies** they used that they thought were **impactful**. They provided the following strategies: • Encouraging the mentee to ask questions (n=10) • Having regular communication and/or check-ins throughout the program to make sure the mentee understands the project (n=10) • Introducing mentee to other members of the research team (n=10) • Giving mentee multiple opportunities to engage in research activities (n=10)

Lessons Learned. Overall, the program was successful in meeting its goals as evidenced by the survey results summarized above. Because of the feedback received, we were able to identify three areas that we plan to improve for next year: (1) We will explore hosting an in-person poster session as opposed to a virtual final presentation. This could provide students with more opportunities to elaborate on findings and respond to individual questions. (2) We will investigate adding professional development speakers that can also discuss industry careers in STEM as opposed to only focusing on academia. We will explore the possibility of organizing coordinated social activities for REU participants. This could provide the opportunity for an expanded network. (3) We will incorporate more discussion in mentor interest meetings and pre-program meetings on how to maintain effective communication throughout the mentored relationship.

GRADUATE STUDENTS AND POSTDOCS

During the 2024-2025 academic year, Johnson held the 4th Mentoring Incubator. The Incubator was designed to give graduate students, postdocs, and faculty the resources and structure to grow professionally and achieve their goals while effectively supporting others in doing the same. In the fall of 2024, six faculty, and two postdocs participated in the program. By introducing the Center for the Improvement of Mentored Experiences in Research (CIMER) mentorship education curriculum, the incubator supports mentor and mentee skill development while engaging participants in understanding their individual needs and interests. To achieve the program goals, four sessions were held during the 2024/2025 fall and spring semesters. **Table 3.1.21** provides the list of sessions held and their descriptions. These sessions were facilitated by four MagLab employees who completed the CIMER training in 2021 (i.e., Kawana Johnson, Roxanne Hughes, Huan Chen, and Kaya Wei).

Participants received certificates of completion, a letter of acknowledgement sent to the Lab's director and their direct supervisor, and a personal thank you letter from the program director. After the program, Johnson conducted a follow-up survey with program participants to expand her knowledge and gain insight into the needed direction of the 2024/2025 program. Feedback from the program participants included a desire to continue the 4-session format and to include more discussion (e.g. conflict resolution) in the session on Maintaining Effective Communication. As a result, the format will remain, but presentation material will be reviewed to determine what information should be removed, modified, or enhanced. The 2025/2026 program began in October 2025 and will end in February 2026.

Table 3.1.21. *2024-2025 Mentoring Incubator Session Topics and Schedule*

Session topics	Dates/Times
Meeting #1 (Aligning Expectations in the Mentoring Relationship)	Wednesday, Oct. 2, 2024 @ 11:30 a.m.
Meeting #2 (Maintaining Effective Communication)	Wednesday, Nov. 6, 2024 @ 11:30 a.m.
Meeting #3 (Assessing Understanding in the Mentoring Relationship)	Wednesday, January 15, 2025 @ 11:30 a.m.
Meeting #4 (Articulating Your Mentoring Philosophy)	Wednesday, Feb. 19, 2025 @ 11.30 a.m.

EVALUATION AND RESEARCH

Evaluation

In 2025, each program manager evaluated their respective programs. The results of these evaluation summaries are shared and discussed with the Director of CIRL to make decisions for next year's programs. Primary metrics for each program are determined based on the program's goals and mission and measured using appropriate methodology. The forms of evaluation are listed in **Table 3.1.22.**

Table 3.1.22. *Evaluation Description for 2024 MagLab Education and Outreach Programs*

Program	Form of Evaluation
MagLab Field trips	Post-program survey to teachers after field trip
Summer Camps	Pre-/post-program survey to students, post-survey to parents, and post-camp survey to teachers
High School Summer Scholars Program	Pre-/post-program survey to students and post-camp survey to teachers
High School Externship	Post-program survey to externship participants, post-program survey to mentors
RET	Pre-/Mid-/Post-program surveys to RET participants, post-program survey to mentors
Magnetic Momentum Scholars Program	Pre-/post-program survey to Magnetic Momentum Scholar participants, post-program focus group and individual interviews with participants, post-program survey to mentors
REU	Pre-/post-program survey to REU participants, mid-program and post-program focus groups with REU participants, post-program survey and interview with mentors

Research

A cornerstone of CIRL's programs is that they are developed based on research conducted by CIRL staff. Our research not only informs our MagLab programs but adds to the broader national conversation around STEM education and mentoring programs. Hughes continues to lead CIRL's research efforts, which focus on building the STEM workforce. In the last year we have expanded our research to include understanding how to build the technical staff. In 2025, CIRL staff had multiple publications that add to the national and international dialogue related to STEM workforce development.

1. Hughes, R., Britsch, B., Dominguez, R., Lucas, K., Olukeye, A., Ndubuisi, S., Sullivan, A., Zogheib, K., (2025) Instilling a Sense of Belonging in STEM through a Virtual Summer Program for Girls. Connected Science Learning. 1–17 https://doi.org/10.1080/24758779.2025.2552958
2. Johnson, K. W. (2025). CTE, STEM, and mentoring: A winning combination. *Mentor Connect Magazine, 7*(3), 16-18. https://www.mentoringassociation.org/publications
3. Johnson, K. W. (2025). Mentored research experiences and their impact on black students in STEM. *Experiential Learning and Teaching in Higher Education, 8*(4), 30-41. https://journals.calstate.edu/elthe/issue/view/455/307
4. Johnson, K. W. (in press). Creating a sense of belonging by engaging skilled technical workers as role models in STEM. The Chronicle of Mentoring & Coaching.

3.2 PUBLIC OUTREACH

Public outreach is run by the MagLab's Public Affairs team who use a comprehensive communications strategy to reach a broad audience with content designed for varying levels of scientific understanding. In 2025, the MagLab posted 13 news stories and was mentioned in about 870 news articles, blogs, or social media posts in outlets such as the Associated Press, the Tallahassee Democrat, MSN, Yahoo News, Science Daily, Magnetics Magazine, and many others with an estimated reach of nearly four billion people.

WEBSITE AND SOCIAL MEDIA

In 2025, the website received more than 4.4 million total "events" (events are a measure of website interactions: view, watch, click, download, scroll, submit a form, etc.) - a 6.5% increase from 2024. Total pageviews increased by about 1% to nearly 1.1 million and total active users increased by more than 45%, to more than 700,000. Areas of the website that saw substantial growth included the research section, up 26%, News & Events, up 21%, Magnet Development, up 12%, and Education, also up 12%. The website continues to see many active users from outside the United States, including Canada, the United Kingdom, India, the Philippines, China, and Singapore.

The MagLab's Instagram account saw nearly 70,000 impressions in 2025, an increase of more than 230%, with a post reach of nearly 37,000, also up 230%.

MagLab's X account had nearly 4,000 followers in 2025. The lab's X account engagement was 3.2%, up nearly 30%. The top tweets of 2025 were about a record-breaking prototype magnet, the premiere of the MagLab virtual field trip, and the lab's Open House **(Figure 3.2.1).**

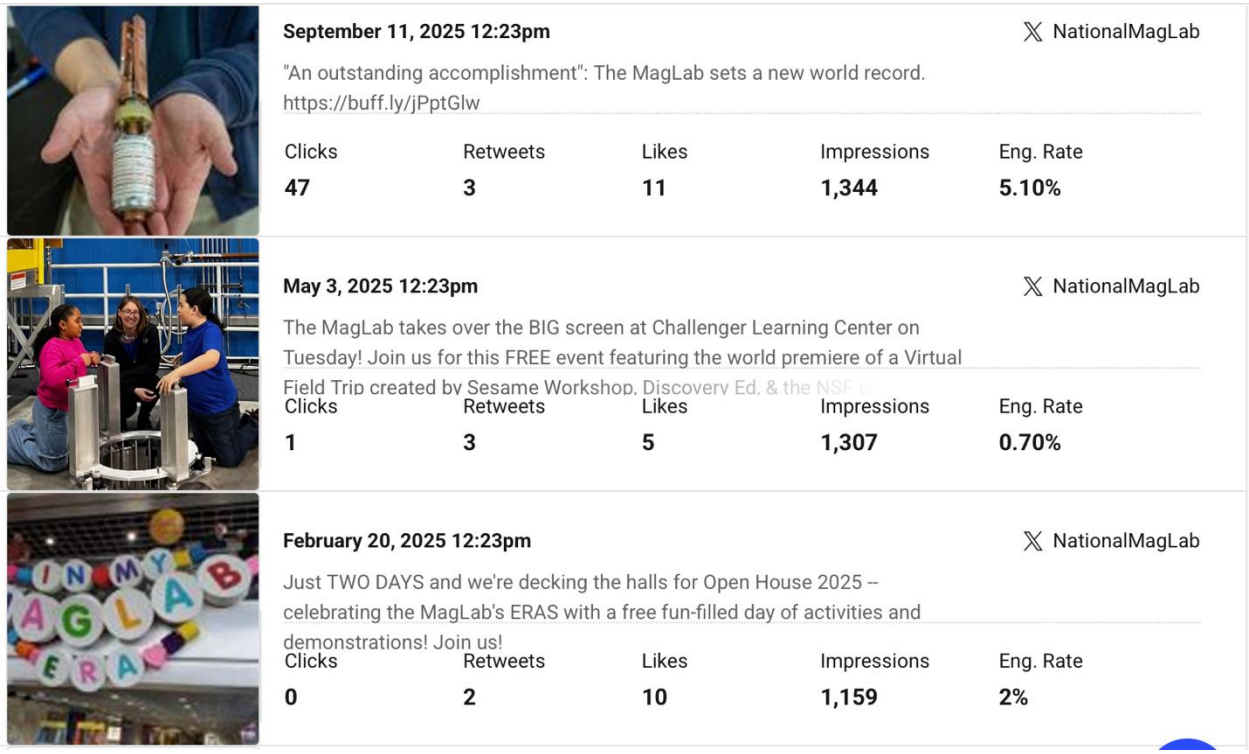

Figure 3.2.1. *Top MagLab Tweets on X.*

The lab's Facebook posts received 140,000 views in 2025 and its audience and followers grew by 5%, reaching different ages, genders, and geographic locations including India, Brazil, Pakistan, Bangladesh, and Mexico. The lab's Facebook audience remains split almost equally between men and women and is well positioned to reach 35-54+-year-old audiences, but with a holistic age distribution that remains broad.

LinkedIn saw nearly 107,000 impressions in 2025, up nearly 80%, along with 6,000 followers, an increase of 25%. Clicks were up more than 80% and engagement rate was at 5%, an increase of 23%. Top posts included installation of a new spectrometer, a User Committee visit, and Kathleen Amm's first anniversary as lab director.

MagLab videos received more than 3.3 million impressions on YouTube in 2025 and were viewed more than 400,000 times. The lab's YouTube channel added more than 500 subscribers to more than 158,000 and nearly 13,000 hours of MagLab videos were watched in 2025. Click through rate on videos increased from 5.4% to 6.5%.

MagLab YouTube viewers come from all ages with about 55% of viewers between 18 and 34. About a quarter of the MagLab's YouTube watchers are female and audiences come from around the globe including India, Canada, the Philippines, Pakistan, Australia, Indonesia, the United Kingdom, South Africa, Sri Lanka, Australia, Malaysia, Ethiopia, Turkey, Brazil, Kenya, Vietnam, Myanmar, Egypt, Germany, Thailand, Iraq, Uganda, Tanzania, and Nigeria.

The most popular videos on the MagLab's YouTube channel continue to be the See-Thru Science video series which shows viewers what electricity and magnetism might look like if they weren't invisible.

EVENTS

The Public Affairs team engaged with excited and enthusiastic audiences throughout 2025. Events are an important way for people of all ages to connect with the MagLab by meeting our researchers, seeing our unique lab spaces, and enjoying the fun of hands-on science. Events excite and inspire young visitors and remind adults that science is important and worthy of continued support.

Figure 3.2.2. *Photos from Open House 2025.*

Our Open House returned on February 22, 2025, and hosted an estimated 10,000 visitors from across the southeast to play with the nearly 100 hands-on demonstrations at Open House 2025 **(Figure 3.2.2).** The 2025 **eras-themed** event invited visitors of all ages to come **celebrate the lab's 30th anniversary and the eras of visioning, building, launching, leading, and evolving over the lab's history. Special** experiences included:

- A **Quantum Dance Party** at the world's strongest magnet where participants compared binary computing with simple 0 and 1 dance moves to quantum computing with freestyle dances.
- An exploration of **Capacitors through Time**
- A **Bitter Disk of Fortune** activity to learn about magnet-making
- A **Magnetic Personalities** attraction where visitors created custom Wooly Willy-style magnetic games.
- A scavenger hunt around the lab to collect beads for a **MagLab Friendship Bracelet**.
- A giant **PlayLab** with spaces inspired by the MagLab, giving kids the chance to put on their lab coats and play the role of a researcher.

Figure 3.2.3. *Photos from 2025 Science Nights.*

Survey data shows that about half of Open House visitors had never been to the lab before the event and that about 90% agreed or strongly agreed that the event helped them better understand the science at the MagLab and how it benefits our community.

The Public Affairs Team completed the 2024-2025 Science Night series at Leon County Libraries and launched the 2025-2026 school year as well (**Table 3.2.1**). Science Night is a public event targeting young children but also acts as a critical engagement point with parents, grandparents, and other guardians of all ages. The six science night events held in 2025 were attended by approximately 500 children and parents **(Figure 3.2.3).**

Each Science Night features a topic/theme and starts with a science story read-along by a MagLab Scientist which is used to help the scientist explain their exciting research to the mostly elementary-aged students and their families. Following the story, students take part in hands-on science with brand-new dynamic activities designed to share the inspiration of science. Participants of all ages also get to engage with MagLab scientists and ask questions.

Results from the 2024/2025 school year Science Night season show that most student participants are elementary school aged and over 90% of kid participants leave feeling that science is fun. More than 90% of parent participants say they also learned something at Science Night.

The Public Affairs Science Night also continued to branch outside of the main library location to offer experiences at branch libraries across the community.

Table 3.2.1. *2025 Science Nights*

Date	Scientist/Topic	Hands-On Activities	Location	Attendees
1/16/25	***Kathleen Amm, MagLab Director*** Magnets are like magic! We'll explore their invisible force and where it comes from. Then, see how you can use magnetic fields for your own magical activities!	• What's Magnetic Exploration • Magnetic Trampoline • Magnetic Motors	Main Library	120
2/13/25	***Steffanie Sillitoe-Kukas, Geochemistry*** Journey back millions of years to the time of the dinosaurs! These creatures that once roamed the Earth left lots behind. We'll dig in to learn how dinos were discovered and how they affected our planet in ways we still see today!	• Dig for Fossils • Dinosaur Stomp • Make your own dinosaur hat	Ft. Braden Branch Library	25
3/20/25	***Abby Centers, DC Field Facility*** What color hair is most common in your class? Does your top score in a video game measure up to your friends'? We'll make numbers come alive when we learn how to chart out the fun in gathering, organizing, and presenting information.	• Skittles Bar Graphs • Pie Chart Party • Venn Diagram Game	Main Library	90
9/18/25	***Ryan Rodgers, ICR*** Scorching one second, pouring rain the next. Explore the science of our dynamic, dramatic weather!	• Atmospheric Pressure Demo • UV Bead Bracelets • Make & Take Rain Gauge and Weather Journal	Main Library	70
10/16/25	***Dayna Richter, NMR*** There's a lot going on between your ears. Discover what's happening in your amazing brain.	• Make a Brain Map Hat • Candy Neurons • Brain Cell Matching Game	Main Library	124
11/20/25	***Marek Polak, ICR*** Scientists find inspiration in everything from birds and bees to flowers and trees. What we've learned from nature — and what's next!	• Camouflage Challenge • Inspired By Nature Match Game • Propagation Station	BL Perry Branch Library	71
2025 TOTAL ATTENDEES				**500**

Public Affairs also held three special events in 2025 to engage with new audiences:

A special **Magnetic Dances** performance on February 7 featured the debut of unique dances, poems and music created by FSU students and faculty in celebration of the MagLab's 30th Anniversary. Inspired by tours of the MagLab, artists worked together on the collection of original performances. The show was held free of charge at FSU's Nancy Smith Fichter Dance Theatre for more than 300 attendees.

The Public Affairs team worked with the National Science Foundation, Sesame Workshop, and Discovery Education to produce a **Virtual Field Trip** to the MagLab. The project was part of an NSF-led initiative to showcase NSF-funded facilities. A production crew spent three days filming with scientists and staff across the lab. The lab launched the virtual field trip in May at a **red-carpet premiere event** in celebration of NSF's 75th Anniversary. The video and paired curriculum resources have since resulted in more than 500 teacher registrations and reached approximately 191,000 students in 53 U.S. states and territories.

The Public Affairs team assisted with design, creation, and unveiling of a **magnetically-levitating sculpture,** nicknamed "Maggie," to celebrate the City of Tallahassee's 200th anniversary, its partnership with FSU and the MagLab, and its distinction as the "Magnetic Capitol of the World." The sculpture was unveiled at the 2025 Motor, Drive Systems, and Magnetics Conference in Tallahassee, garnering local and national media coverage. **(Figure 3.2.4)**

Figure 3.2.4 *The magnetically levitating sculpture unveiled at the 2025 Motro, Drive Systems, and Magnetics Conference in Tallahassee, commemorating the city as the "Magnetic Capital of the World."*

3.3. CONFERENCES AND WORKSHOPS

Each year, the MagLab hosts or sponsors a variety of workshops and conferences related to high magnetic field research **(Table 3.3.1)** In 2025, ten conferences/workshops were hosted by the MagLab:

Table 3.3.1. *List of 2025 sponsored workshops and conferences.*

Event	Date	Location/ Type	Description	Attendees
Theory Winter School	January 6-10	In-Person Tallahassee, FL	The principal theme of this 13th theory winter school is exploring strongly correlated physics across newly accessible length and energy scales. Many aspects of this subject (moiré graphene and transition metal dichalcogenides, fractional Chern insulators, Wigner crystals and strange metals) have become active areas of research leading to	98 (speakers + attendees)

Event	Date	Location/ Type	Description	Attendees
			new theories, experiments and computational methods to address them. This event worked to initiate closer dialogue between the various subfields and discuss the open questions at the forefront of this area of research.	
The Second Fusion Magnet Community Workshop	January 21-23	In-Person Tallahassee, FL *(moved to hybrid after snow and ice forced FSU to close)*	This workshop better defined R&D gaps, and research objectives of the U.S. fusion magnet community. The workshop included fusion companies, public fusion program participants, and universities in the U.S. fusion magnet community. Significant technology maturation efforts are underway to demonstrate the compact high field approach for commercial fusion.	80
The 14th North American FT MS Conference	March 30 – April 3	In-Person Tahoe City, CA	The FT MS Conference is held every two years and is the premier of its kind in the field of Fourier Transform Mass Spectrometry and its applications. Presentations range from instrumentation and technique development to applications ranging from pharmaceutical metabolism to proteomics, environmental analysis and petroleomics, with special emphasis on new developments. As in the past, partial support for several contributed posters for graduate students and postdocs will be offered.	58
2025 Radio Frequency Coil Workshop	May 5-9	In-Person Gainesville, FL	The content of this five-day workshop is designed to introduce graduate and post-doctoral students to the fundamentals of MRI coil design, construction, and testing. The workshop will focus on technical details of coil design and construction, including practical aspects of circuit design and construction, coil assembly and tuning, and coil testing. Participants will gain hands-on practice with RF tuning and matching, coil pattern design, cable making, impedance matching, basic soldering, 3D printing, and trap circuits. They will each build their own working surface coil that they will be able to take to their home lab on completion of the workshop.	4
MagLab Summer School on Solid State NMR Spectroscopy	May 12-16	In-Person Tallahassee, FL	The weeklong summer school features tutorials on NMR basics and lectures from experts in the field of solid-state NMR spectroscopy.	18
MagLab User Summer School	May 12-16	In Person Tallahassee, FL	The weeklong summer school features tutorials on measurement techniques, practical exercises and plenary talks from experts in the field of condensed matter physics.	17
Micro Imaging RF Coil Workshop	August 11-15	In-Person Tallahassee, FL	A 5-day advanced coil workshop on building radio frequency MRI (Magnetic Resonance Imaging) volume coils. This workshop focused on constructing a birdcage volume coil for a 500 MHz MRI micro-imaging system. Participants gained both theoretical knowledge and hands-on experience in coil construction, tuning, and impedance matching. Additionally, the workshop included a 1-day on-site training session on performing EM simulations by CST	6

Event	Date	Location/ Type	Description	Attendees
			engineers, and a 1-day Bruker Paravision training to learn about pulse programming and magnet experimental setups.	
External Advisory Committee Meeting	August 18-20	In Person Tallahassee, FL	The EAC is charged with reporting on the State of the MagLab to the leadership of its three partner institutions: Florida State University, the University of Florida, and Los Alamos National Laboratory.	60
User Workshop & Committee Meeting	November 4-6	In Person Tallahassee, FL	An annual meeting of users who represent the laboratory's broad multidisciplinary user community and advise lab leadership on all issues affecting users of our facilities. The User Workshop had a special focus on the 2028–2032 Renewal Proposal, offering a unique opportunity for users to contribute to long-term planning and priorities.	75
Southeastern Magnetic Resonance Conference	November 14-16	In Person Gainesville, FL	**SEMRC 2025 brought** together students, postdoctoral researchers, faculty, and industry partners from 16 states for three inspiring days of scientific exchange and collaboration. The conference featured **86 abstracts and presentations** across NMR, MRI, and EPR, made possible through the support of **14 participating sponsors**, and fostered an atmosphere of energy, discovery, and connection. Excellence in research and presentation was celebrated through **18 Best Presentation Awards**, highlighting the exceptional talent and innovation within the magnetic resonance community. In addition to showcasing cutting-edge science, SEMRC 2025 proudly honored **Dr. Thomas Mareci**, whose influence has shaped generations of researchers and advanced the frontiers of MRI technology.	30 registrants

3.4 BROADENING OUTREACH

In addition to the Education and Outreach sections of this report, which speak to the MagLab's work to broaden participation through education and outreach, MagLab staff regularly take advantage of conferences and workshops to share information about the lab's user program with diverse researchers from around the globe. Each talk, presentation, poster, or abstract opportunity provides the chance for scientists to learn more about the lab's research capabilities and broaden our user program to new scientists from across disciplines and career levels – from graduate students and postdocs to track faculty.

In 2025, MagLab staff gave **146** lectures, talks, and presentations to organizations around the country and the world **(Figures 3.4.1, 3.4.2, and 3.4.3)**.

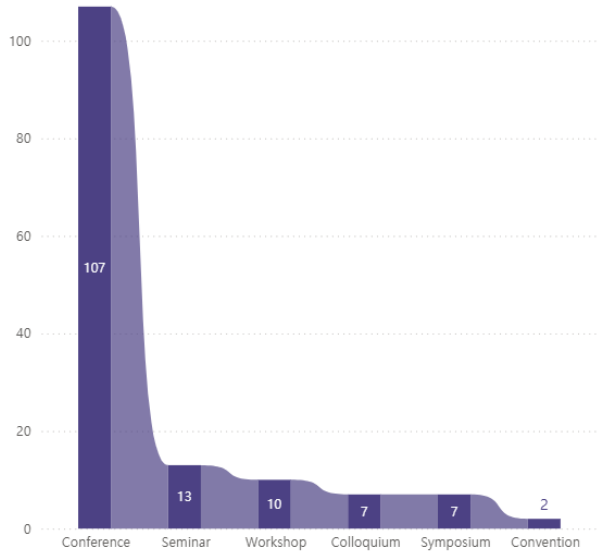

Figure 3.4.1. *2025 Presentation types.*

During the year, the MagLab continued the important work to broaden participation through outreach and presentations at prominent meetings and conferences including the American Physical Society (APS) March Meeting, 14th North American Fourier Transform Mass Spectrometry (FT-MS) Conference, 17th European Conference on Applied Superconductivity (EUCAS), Experimental Nuclear Magnetic Resonance Conference (ENC) jointly with International Society of Magnetic Resonance (ISMAR), and 29th International Conference on Magnet Technology (MT-29).

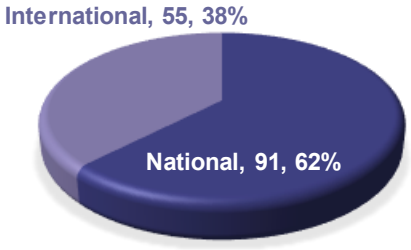

Figure 3.4.3. *Breakdown of 2025 presentations by geographic distribution.*

4. IN-HOUSE RESEARCH IN SUPPORT OF THE USER PROGRAM

4.1 MAGNETS AND MATERIALS

APPLIED SUPERCONDUCTIVITY CENTER

The Applied Superconductivity Center (ASC) supports the development of magnet technologies from materials through significant R&D feasibility validations. Work at ASC defines the limits of conductor, magnet components, and magnets with test magnets and post-test analyses using extensive materials science and physics tools. There is a natural transition from ASC to the missions of MS&T, DOE labs, and magnet manufacturers. ASC also develops characterizations of structure and properties that definitively connect processing with performance, with characterization tools to find processing origins and material root causes of performance shortfalls. This provides a natural pathway for collaboration with conductor manufacturers. ASC extends the boundaries of knowledge in materials, conductors, and magnets via a portfolio of high-impact research grants including the NSF core grant to MagLab, leveraging collaborations with other laboratories and institutions, and commercial partnerships. Teaching faculty in ASC aim to propagate knowledge and training via support of MS, PhD, and post-doctoral staff, interactions with industry and federal agencies, participation in review panels and oversight committees, and support of publications, conferences, and learned societies.

MAGNET SCIENCE AND TECHNOLOGY

The Magnet Science and Technology (MS&T) division supports the NHMFL's Mission to develop, operate, and maintain existing and new magnet systems that enable a world-leading high-magnetic-field user program. MS&T continued to make important progress on the all-superconducting 40T magnet design and developmental coil testing; fabrication of large, pulsed coils for the LANL 60T Controlled Wave (CW) and 100T multi-shot magnets; development of the high-strength, high-conductivity materials required for pulsed and DC resistive magnets and continuing to maintain the suite of resistive magnets in the DC Field Facility including the world-record high fields produced by the 45T Hybrid, the 36T, 1ppm Series-Connected Hybrid, and the 41.5T all-resistive magnets. In addition, high temperature superconducting insert coils for a commercial 25T all-superconducting magnet have been developed in MS&T in collaboration with a commercial partner, Cryomagnetics. The following sections further describe the achievements in these areas.

PROGRESS DURING THIS REPORTING PERIOD

Bi-2212 coil technology at ASC: Preserving coil integrity under high mechanical loads when generating and operating in high magnetic fields is a major challenge in the development of Bi-2212 based high field magnet technology. Since the mechanical properties of the bare wire are limited by the choice of the electrical stabilizer the Bi-2212 ceramic component is embedded in, reinforcement needs to be added on either, the conductor level, coil level or both. In 2025, the ASC focused on a two-prong approach, understanding and developing reinforcement schemes on the conductor level as well as preparing a new series of coils with the goal for 2026 to reach 20T and exceed a supported source stress of about 400 MPa. A set of three coils with similar geometries and layouts is currently under preparation to pursue this goal. Two of these coils will be used to evaluate the design of the coil terminals and are

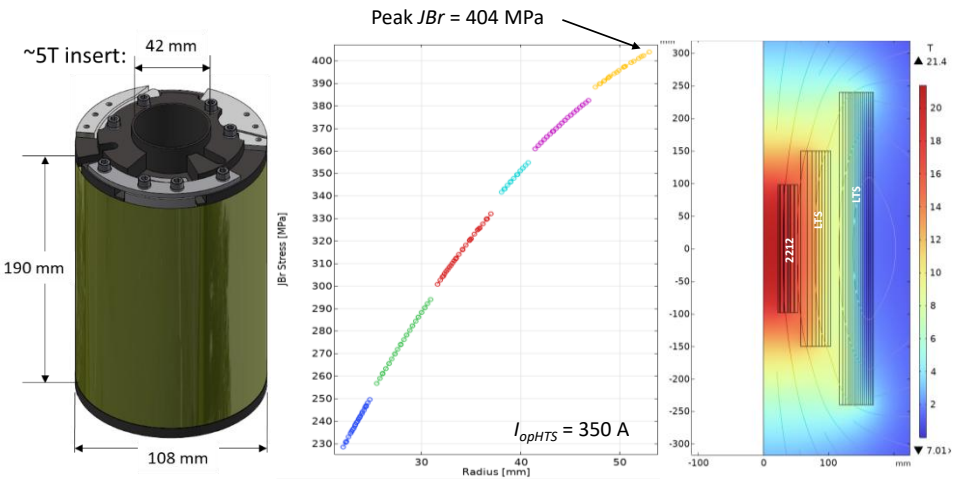

Fig. 4.1.1 *(left) Bi-2212 insert coil to generate 20 +T in the ASC 16T LTS magnet system. The coil will have 20 layers and use about 600m of conductor (middle) The σ(r) plot shows the expected source stresses across the coil's sub-sections. (right) shows a field plot of the coil inserted into the 16T LTS outsert magnet.*

Fig. 4.1.2 *Large diameter Bi-2212 test coil with 3D printed mandrel to evaluate stresses on the order of 600MPa.*

smaller in height while the third one will have full height as shown in **Figure 4.1.1**. All three coils will be tested with the taller third coil being expected to generate a combined field of 21.4T at an operating current of 350A. Parallel to this effort a series of large diameter test coils with small winding thickness of 4 to 6 layers are currently being prepared to explore stresses exceeding >>400MPa with the goal to pave the way towards the design of magnet systems capable of reaching 30T. One of these coils will make use of an Inconel 3d printed mandrel, which, if proven viable during its evaluation, will allow for higher flexibility in the choice of bore sizes, which is of particular importance in a nested insert magnet design, **Figure 4.1.2.** Together with other coil reinforcement strategies, one objective of a nested coil design is stress management by dividing the insert magnet into sub-sections. Without using 3d printing the choice of where to section the magnet is limited to available Inconel tube stock. These coils will be tested in the ASC's 12T, 161mm cold bore magnet system and ideally provide information towards the design of a 25+T NIH funded high homogeneity NMR demonstrator magnet that is planned to operate in the ASC's 12T, 212mm cold bore test bed. This magnet is expected to withstand stresses of about 620MPa and ways are currently being explored how to get there, **Figure 4.1.3.** One of these ways is the introduction of a specific high strength ceramic braid around the conductor that besides the braid itself, will include six fibers that run in tensile direction along the length of the conductor. This type of reinforced conductor will be used in the coil with the 3d printed mandrel.

Materials for Coil Reinforcement: Due to the requirement that Bi-2212 conductor wound coils must undergo heat treatment at high temperatures to become fully superconducting, ceramic braids surrounding Bi-2212 wire are commonly used as electrical insulation. Previous experiments on rectangular composite winding pack samples revealed that this insulating braid also provides significant reinforcement to Bi-2212 coils. Until recently, Bi-2212 wires were braided externally, limiting our control over the structure and materials used for this braided insulation. The purchase of a braiding machine has allowed us to explore how changing various aspects of the insulating braid can influence the mechanical properties of the Bi-2212 winding pack. Our study into insulating braids has focused on two aspects: the structure of the braiding and the braiding material itself. The braiding machine can fabricate braids with various patterns and specifications. One of these specifications is the 'picks per inch' or PPI of the braids.

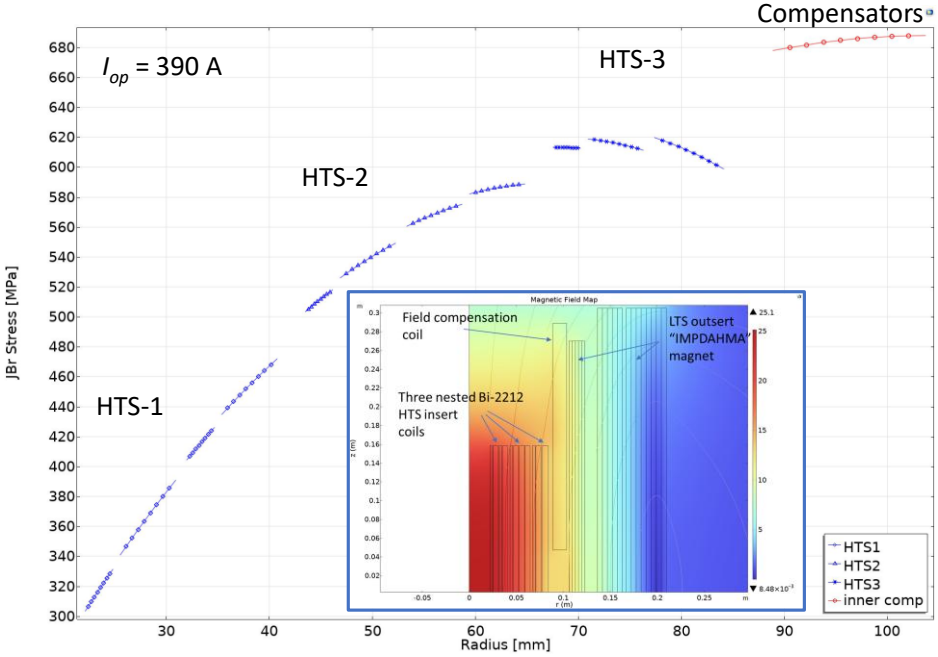

Fig. 4.1.3 *σ(r) plot of the NMR demonstrator coil assembly. The complete insert will consist of three Bi-2212 insert coils nested inside the ASC's 12, 212mm LTS outsert magnet. A pair of Nb_3Sn coils around the HTS insert will be used for first order field compensation.*

(a) (b)

Fig. 4.1.4 *(a) 20 PPI coreless braid and (b) 8 PPI coreless braid, both made with 95/5 (95% Al_2O_3, 5% SiO_2) ceramic fibers.*

This is essentially the number of times the fibers cross over each other within an inch. **Figure 4.1.4** shows two ceramic fiber braids fabricated. **Figure 4.1.4a** shows a high density, 20PPI braid, while **Figure 4.1.4b** shows a lower density, 8PPI braid. Tensile tests were performed on these coreless fiber braids to establish how PPI influences their strength and stiffness. **Figure 4.1.5** shows the results of these tensile tests. The stress-strain curve for 8PPI braid was far steeper than the curve for the higher, 20PPI braid. The average Young's modulus of the 8PPI braid was found to be 28.4GPa, almost 7.5 times larger than the 20PPI braid, which was calculated to have an average Young's modulus of 3.8GPa. Furthermore, **Figure 4.1.5** shows that the 8PPI braid was also far stronger than the 20PPI braid, reaching almost 450MPa of stress before fracture while the 20PPI braid fractured at a stress closer to 150MPa. Previously, Bi-2212 magnets fabricated at ASC were insulated with mullite (72% Al_2O_3, 28% SiO_2) fibers as supplied by the conductor manufacturer and co-wound with stronger pure alumina fibers for reinforcement. The braiding machine has allowed us to experiment with combining this insulation and reinforcement, by braiding the Bi-2212 wire with higher strength alumina fibers. We have braided lengths of wire with 10PPI braids made from mullite fibers, 95/5 fibers (95% Al_2O_3, 5% SiO_2), and >99% purity alumina fibers. An additional length of Bi-2212 wire was also braided with a higher density 25PPI 95/5 fiber braid. To establish and compare the mechanical properties of Bi-2212 winding packs including these braids, rectangular winding pack samples were fabricated. The braid insulated Bi-2212 wire was wound in several layers onto a racetrack-type mandrel and annealed in flowing oxygen. These coils were then vacuum impregnated with epoxy and sectioned into several straight samples. These samples were then equipped with an array of film strain gauges, and load-tested in an MTS machine in liquid nitrogen at 77K. **Figure 4.1.6** shows the results of these tensile tests. The samples containing the pure alumina braids were the steepest and therefore the stiffest. The average Young's modulus of this sample group was 86.8GPa. The 10PPI 95/5 braided samples, whose fibers had the second highest alumina content, were the second stiffest, with an average Young's modulus of 53.0GPa. The group of samples that contained a mullite braid with the addition of a pure alumina co-wind had a slightly lower Young's modulus of 47.7GPa. However, these samples were still significantly stiffer than previously tested samples, which contained a mullite braid and no co-wind, as those had an average

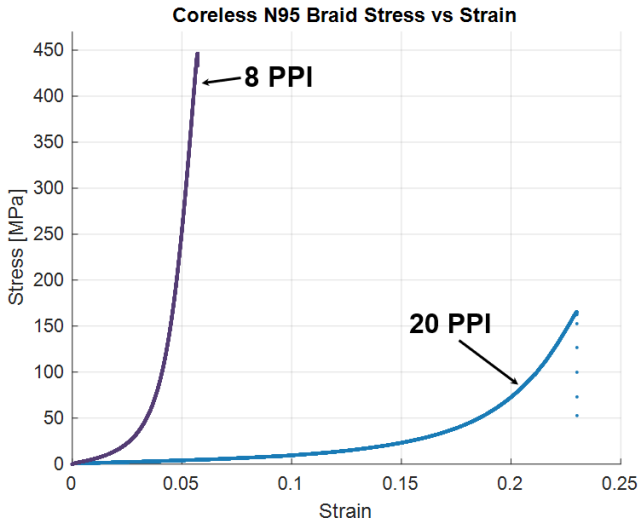

Fig. 4.1.5 *Room temperature stress vs. strain curves for coreless braids made from 95/5 fibers.*

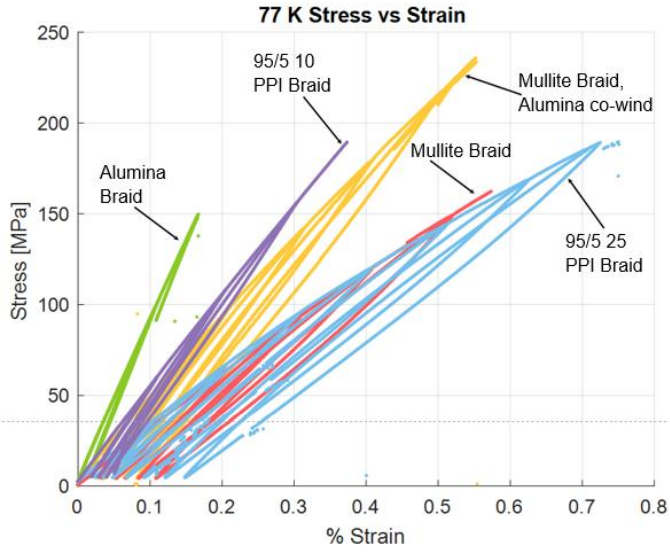

Fig. 4.1.6 *77K stress vs. strain curves for rectangular winding pack composite samples.*

Young's modulus of 32.3GPa. The samples containing the 25PPI 95/5 braid had a Young's modulus of 31.8GPa, the smallest of all the samples tested. This is far less stiff than the samples containing the 10PPI 95/5 braid, following the same trend as the results of the coreless braid tensile tests discussed previously. Therefore, to best reinforce the Bi-2212 winding pack, insulating braids should have a high alumina content and low PPI.

Fig. 4.1.7 *ASC's two over-pressure furnaces. The two overpressure heat treatment furnaces for reacting Bi-2212 magnets with the smaller one in the front and the larger one in the rear. A bank of gas bottles that provide the furnaces with a high-pressure gas mix of 98% argon and 2% oxygen can be seen to the right.*

Coil heat treatment: In 2025, we completed the commissioning of the large "Renegade" over-pressure furnace as well as the upgrade of the smaller "Deltech" furnace using a more robust heater technology than originally provided by the manufacturer, **Figure 4.1.7.** Magnets have been processed in both furnaces alongside efforts to understand and extend the uniform zone, cylindrical volume capable of ±2°C across the Bi-2212 melt-phase of the heat treatment (> 872°C). The uniform zone has been extended to over 0.5m at 50 bar pressure for the Renegade by extending the temperature ramping time prior to melt to 38 hours and to 83 hours for the entire heat treatment, reducing the heating rates and approaching closer to steady-state temperature gradients in the super critical gas environment. As demonstrator magnets of 1m length are a key milestone of the HEP program, a study was conducted to find the trade-off between furnace pressure and uniform zone to achieve a 1 m uniform zone, with result shown to be between 20-25 bar, **Figure 4.1.8.** We plan to run a similar study on the Deltech furnace this year. The Renegade furnace has seen 11 full heat treatments, including 4 magnets, since November of 2024. This also includes the pressure to uniform zone relationship study and a radial-mapping-study that showed no significant radial temperature gradient within the uniform zone. The upgraded Deltech furnace has seen 5 heat treatments, including 3 magnets since June of 2025.

Extensive collaboration at ASC with the REBCO venders to improve the US coated conductor supply chain: Among the various REBCO deposition techniques used in production, pulsed laser deposition (PLD) has been widely recognized as the most viable method for achieving adequate production throughput which potentially meets strict manufacturing cost requirements. Indeed, several major international REBCO suppliers have adopted PLD and remain globally competitive. However, no US company has employed PLD for REBCO conductor manufacturing, raising concerns about potential vulnerabilities in the domestic REBCO supply chain. Under the DOE ARPA-E program, Applied Superconductivity Center has been collaborating with the California-based venture company High Temperature Superconductor Inc (HTSI) to establish competitive PLD REBCO conductor manufacturing capacity in US by providing comprehensive superconducting and microstructural characterization. Nano-precipitation is a central strategy for introducing effective pinning centers in high J_c REBCO thin films and underpins modern high J_c REBCO coated conductor manufacturing. However, controlling the precipitation over the full width and length, between the production batches remains a major challenge. We comprehensively assessed J_c in fields to investigate how Y_2O_3 precipitation occurs and affects J_c in production R&D PLD YBCO coated conductors (CCs) delivered by HTSI.

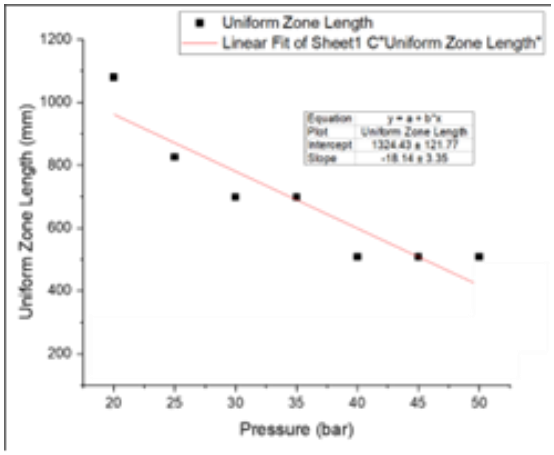

Fig. 4.1.8 *Height of uniform (±2°C) cylindrical volume for reacting Bi-2212 magnets inside the large over-pressure furnace as a function of pressure. Achieving a 1m uniform zone is a key milestone for HEP demonstrator magnets.*

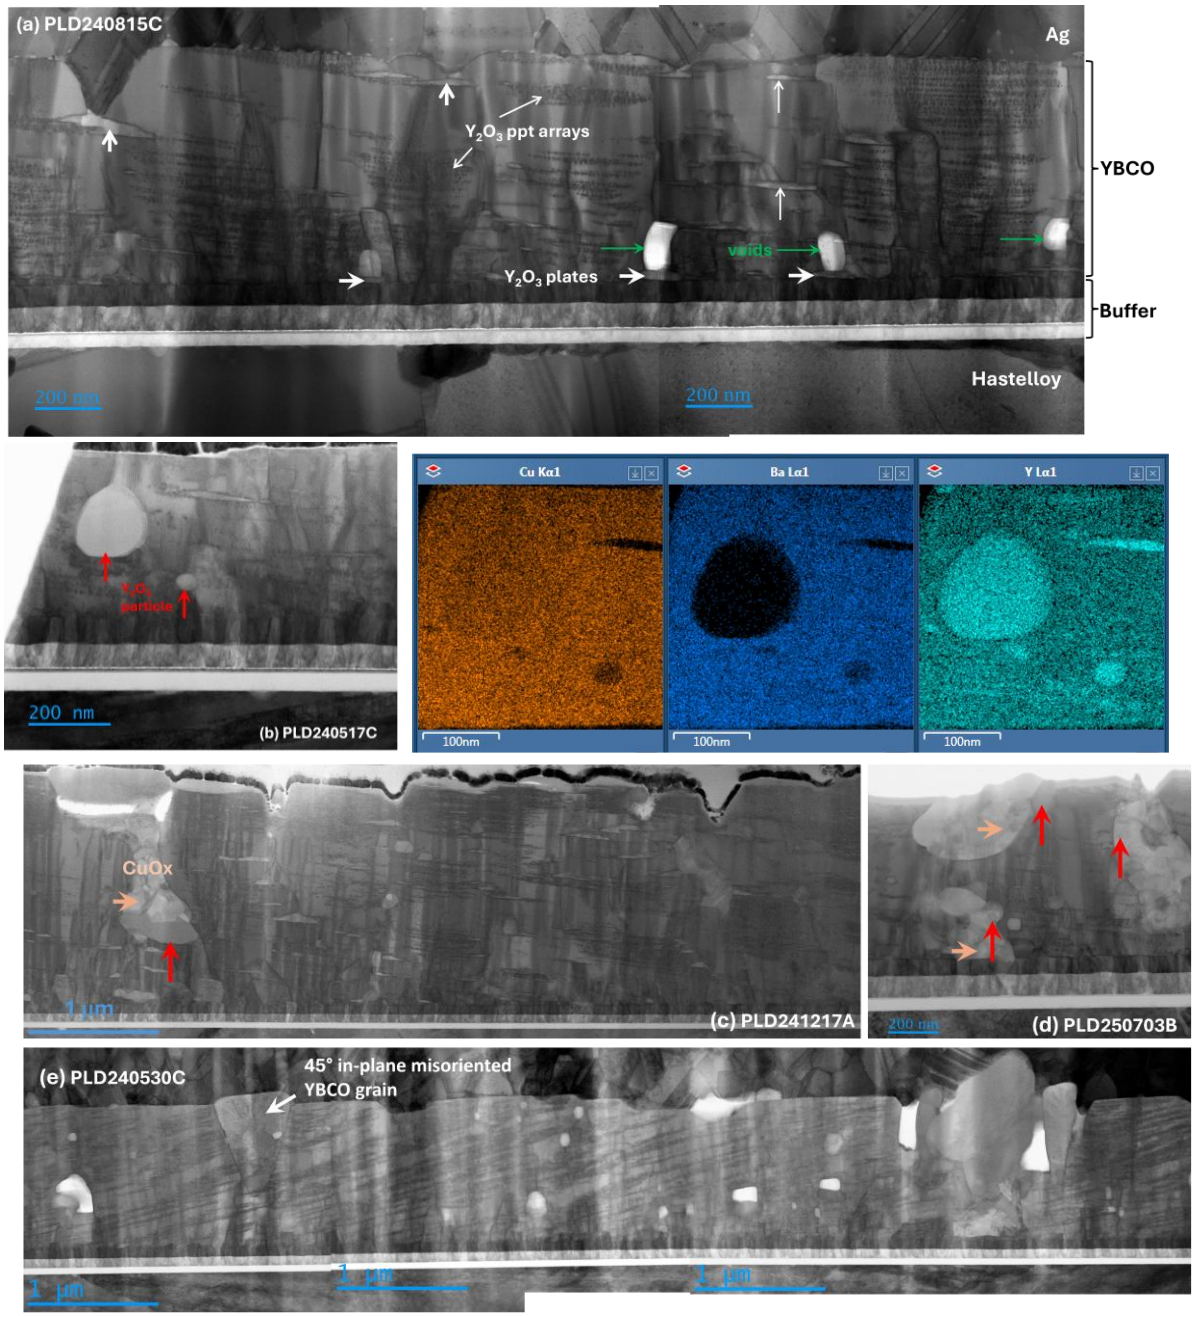

Fig. 4.1.9 *TEM images of PLD YBCO CCs that contains Y_2O_3 ppt arrays as essential pinning centers, and various Y_2O_3 phase related submicron defects. (a) PLD240815C that contains Y_2O_3 ppt arrays that are pointed by the tilt arrows, Y_2O_3 plates include those distributing at the interface between YBCO and the buffer layer and promoting void formation, those occurring inside YBCO layer and interrupting the growth of Y_2O_3 precipitates, and those being at the top YBCO layer and depressing YBCO growth. (b) PLD240517C that contains, in addition to Y_2O_3 precipitate arrays, large Y_2O_3 particles inside YBCO. The EDS maps on the right identified the Y_2O_3 phase of the plates and large second phase particles. (c) PLD241217A and (d) PLD250703B to highlight the CuOx particles accompanied with Y_2O_3 particles; (e) PLD240530C that contains dense, uniformly distributed Y_2O_3 ppt arrays, along with occasional occurrences of plates, particles, voids, and misoriented YBCO grains.*

Cross-sectional STEM images of five production R&D YBCO coated conductors (**Figure 4.1.9**) revealed that fine Y_2O_3 precipitates (5–10nm in the ab-plane and 3–5nm along the c-axis) are the major correlative pinning center, but also a wide variety of larger sub-micron Y_2O_3 phase (Y_2O_3 plates (50–200nm × 20–40nm) and large rounded Y_2O_3 particles (50–500nm)) which is not typically observed in well-controlled lab-grown films. PLD240815C exhibits the cleanest microstructure, containing only non-uniformly distributed Y_2O_3 precipitate arrays, occasional Y_2O_3 plates, and voids formed at the YBCO/buffer interface directly above the plates, which also interrupt precipitate array development and locally suppress YBCO growth. In PLD240517C, large Y_2O_3 particles (~160nm and ~50nm) form within the YBCO layer alongside the precipitate arrays and Y_2O_3 plates, with elemental mapping confirming their composition. A distinct feature in PLD241217A and PLD250703B is the presence of CuO_x particles co-nucleating with Y_2O_3

particles, either as large CuO_x particles sitting atop large Y_2O_3 particles or as clusters of smaller mixed particles, both of which tend to obstruct current flow.

The angular and field-dependent transport measurements (**Figure 4.1.10a**) showed that PLD240815C consistently exhibits the strongest performance among the samples, while PLD241217A shows the

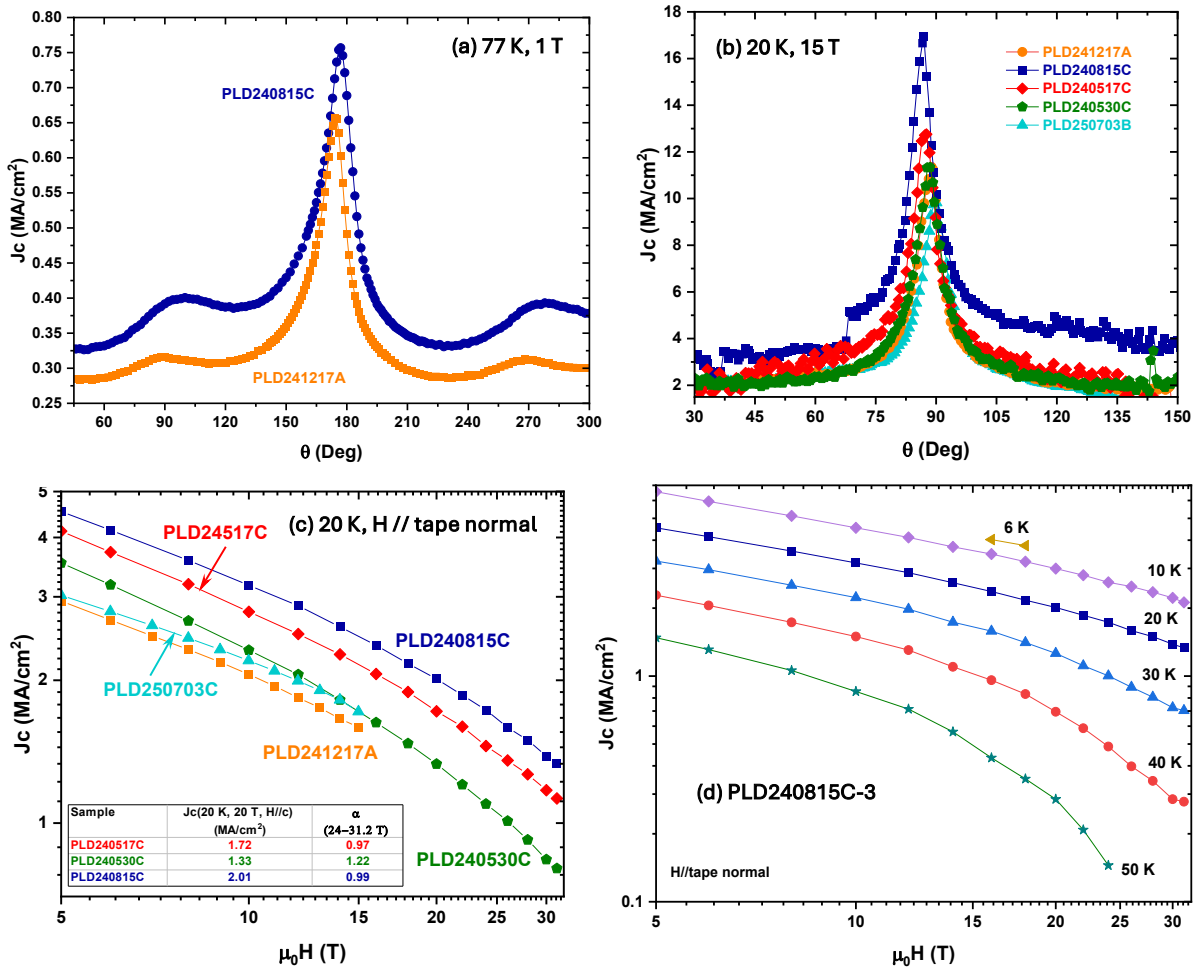

Figure 4.1.10 *$J_c(\theta)$ at (a) 77K, 1T for PLD240815C and PLD241217A, and (b) 20K and 15T for all 5 CCs. At 77K and 1T, the 2 samples show similar angular dependence, and at 20K and 15T, all samples show GL-like $J_c(\theta)$ with amplified J_c variation. (c) J_c(H//c) at 20K for all 5 CCs, and (d) J_c(H//c) from 10 to 50K for PLD240815C. The inset of (a) summarizes J_c(20K, 20T, H//c) and the corresponding α value for $J_c \propto H^{-\alpha}$. Both J_c value and the field dependence vary from sample to sample, suggesting variations in both the dominant pinning and the current blocking mechanisms.*

weakest. At 77K and 1T, PLD240815C and PLD241217A display nearly identical $J_c(\theta)$ shapes with a small c-axis peak and a sharp ab-plane peak, indicating similar strong-pinning landscapes. But PLD241217A maintains lower Jc across all angles, implying current-blocking mechanisms. At 20K and 15T (**Figure 4.1.10b**), all samples show GL-like angular dependence of J_c with monotonic enhancement toward H//ab, but exhibit substantial variation in J_c magnitude and ab-peak shift. Notably, J_c(H//ab) ranges from 9.8 to16.9MA/cm² with much larger sample-to-sample variation than at 77K and 1T, suggesting that different dominant pinning mechanism play the role at the 20K, 15T regime. Field-dependent J_c(H//c) (**Figure 4.1.10c**) further confirm the superior performance of PLD240815C, which reaches 2.01MA/cm² at 20K and 20T, while PLD241217A remains the lowest across intermediate fields. Power-law fits from 24–31T yield α values ranging from 0.97–0.99 for PLD240517C and PLD240815C to 1.22 for PLD240530C, the latter indicating a strong weak-pinning contribution (**Figure 4.1.10d**), yet this sample paradoxically shows low J_c, highlighting the significant impact of current-blocking defects. Temperature-dependent J_c(H//c) for PLD240815C illustrates the shrinking high-field power-law regime with increasing temperature due to thermal depinning, an observation later used to analyze weak-pinning differences relative to PLD240530C.

In summary, our scientific and technical feedback of I_c/J_c and its nanostructural correlations has significantly contributed to the REBCO production R&D at HTSI. We will continue to work with HTSI to improve the production of US PLD REBCO.

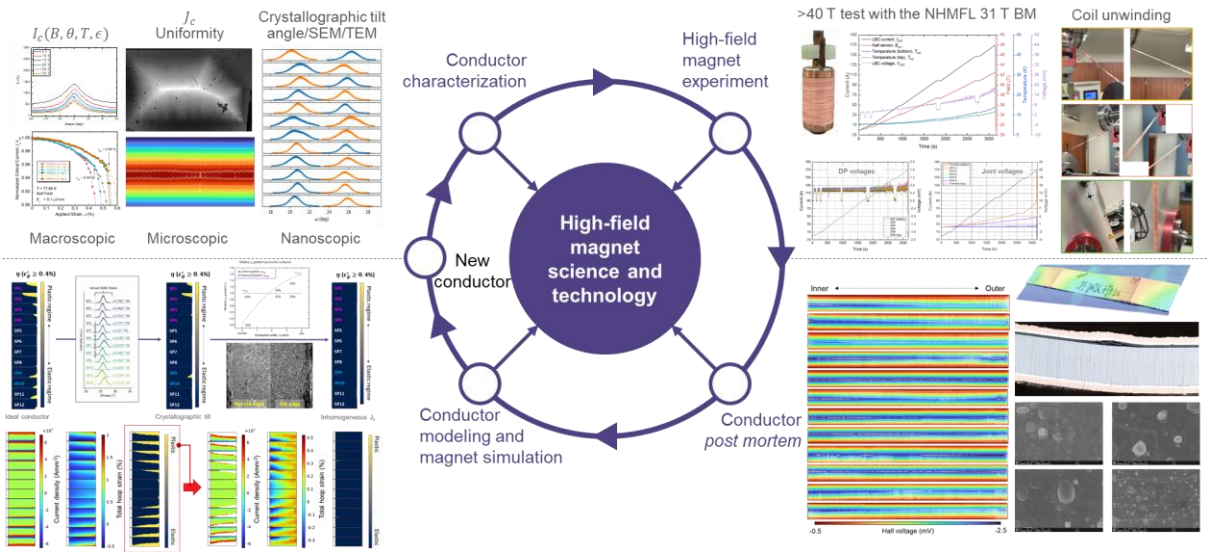

Figure 4.1.11: *A well-defined recursive design-build-test loop designed by NHMFL-ASC*

Little Big (REBCO) coil program at ASC: ASC has established a well-defined, recursive design-build-test loop for an R&D magnet test bed (Little Big Coil which generates stresses > 800MPa and fields now up to almost 49T inside the 31T Bitter magnet. This design-build-test-postmortem paradigm guides us in refining our conductor characterization needs and our coil simulation models (**Figure 4.1.11**). Under the key philosophy of "no magnets are better than their conductors," we first perform detailed conductor characterizations, choose tapes for coil winding, design and fabricate a coil, test it in the NHMFL 31.1T Bitter magnet, push it to its limits until the coil quenches, and then conduct a detailed postmortem. We continuously find new surprises about the response of the conductor to such high stresses that vary from

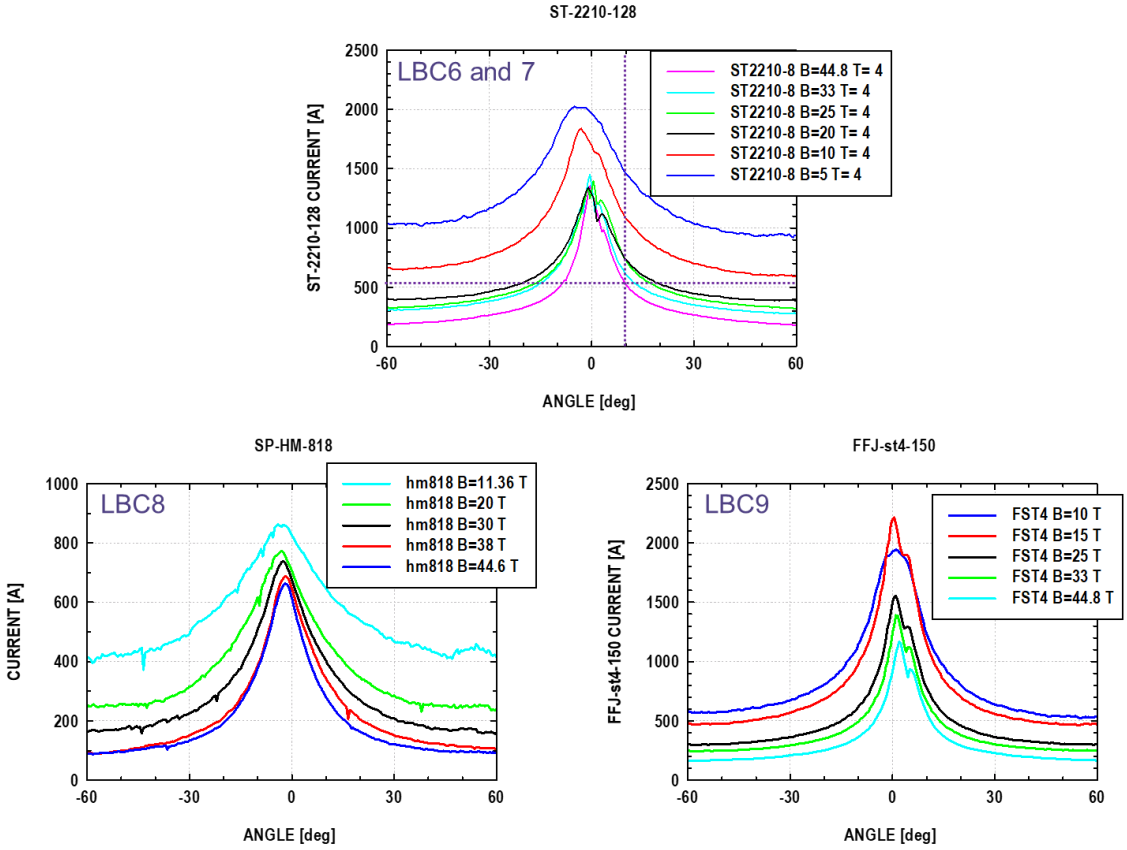

Fig. 4.1.12 *Torque I_c measurement results of REBCO samples of recent LBC6—9 tapes via the NHMFL 45T 32mm (19mm room temperature bore) hybrid magnet, the world's first $I_c(Q,B,T)$ measurement at 45T.*

manufacturer to manufacturer. We use this test bed as means to define a safer REBCO high-field superconducting magnet science and technology. Our postmortems are based on an almost unique variety of methods, such as reel-to-reel magnetization mapping, magneto-optical imaging, scanning electron microscopy, X-ray diffractometry, torque magnetometry to give the full I_c(Q,B,T), Walters spring critical strain measurements, and uniaxial tensile tests. This variety of tests enables us to define the conductor properties in great detail with respect to many properties seldom considered: for example the length-wise critical current uniformity, the width-wise critical current uniformity, the presence of local defects (including micro-cracks, precipitates, misoriented grains, etc.) that may affect both mechanical and superconducting properties, the crystallographic tilt angle that strongly affects screening current stress enhancements, field and temperature dependent critical current properties, strain-dependent critical current property, and stress-strain curve, which are all important factors in the coil design, construction, test, and postmortem of our World Record Little Big Coil test beds.

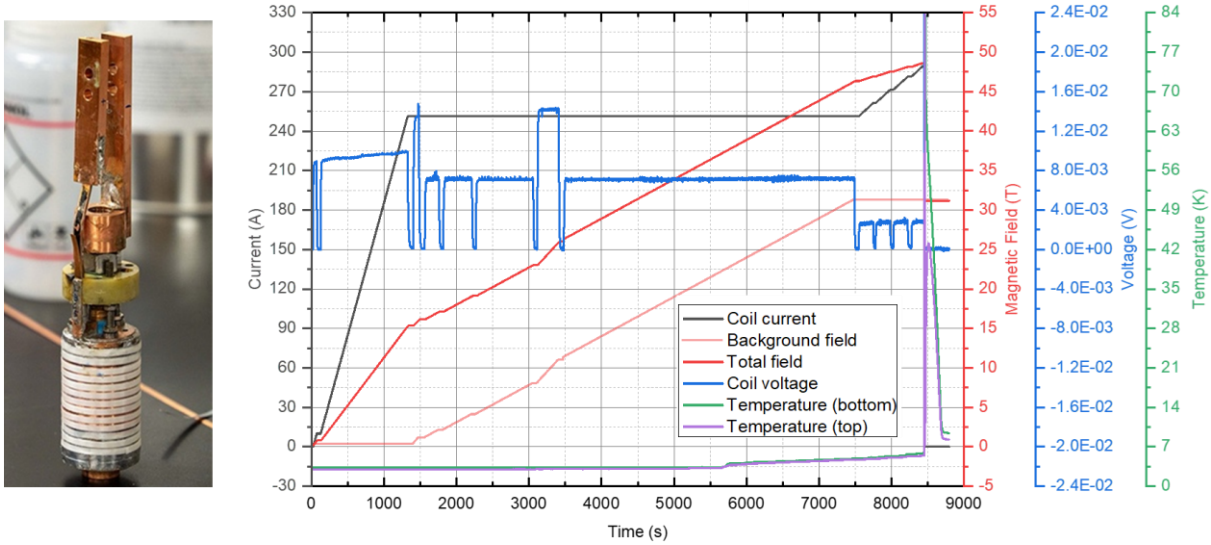

Fig. 4.1.13 *(left) LBC9, the record coil for 48.7T. (right) shows test results during attainment of the world record 48.7T DC field. LBC9 was tested in the NHMFL 31.2T 50mm (42mm room-temperature bore) Bitter magnet.*

The world's first 45T conductor I_c characterization and a new world record of 48.7T via the NHMFL-ASC 'Little Big Coil (LBC)' testbed: In 2025, we achieved several important new results. First of all, we characterized the full angular I_c(Q,B,T) of LBC tapes up to 45T using the MagLab 45 T hybrid magnet, a world's first (**Figure 4.1.12**). During 2025, we were able to increase our test rate to four a year (previously one coil a year), by innovating our coil fabrication process and modularizing it. Lastly, based on the characterized results, we designed, fabricated, and tested four LBCs (LBC6,7,8 and 9) in 2025, then finally, twice broke the previous DC field record of 45.5T with 46.0 and 48.7T coils (**Figure 4.1.13**). This achievement not only gives us hope that we can soon reach the next big benchmark magnetic field of 50T but also continues to make our understanding of conductors better. We now know very clearly that some conductors show permanent plastic yielding under such ultra-high field testing which generates stresses of ~1GPa or more. But others do not! Based on the lessons learned from our 2025 LBC6—9 test campaign, we plan to make 5 or 6 LBC tests in 2026.

Higher Current Density Mechanically Robust REBCO Cable Solenoid Survives Fatigue Testing at ASC: The second HTS Conductor On Round Core (CORC®) cable-wound solenoid was rewound, received, and tested in our large-bore 12T test bed, Magnet for Optimization & Novel Assessment of Realistic Cables (MONARC). The coil survived 99 operating current cycles to a peak 230MPa JBr Hoop stress, 155 cycles at lower stress levels, 14 quenches in liquid nitrogen and self-field, and 5 thermal-cycles from room temperature to below 77K. In-field testing was cut short by the extremely effective HTS quench protection circuit false positive protection causing an inductive trip of the LTS magnet prior to cycling at max current. However, follow-up testing in liquid nitrogen validated no loss in critical current, but a 18% drop in the index of transition (n-value) after the high stress operation showing that the current sharing has definitively changed, strengthening the observations of dynamic current redistribution observed in the testing of the first coil. With no clear signs of damage, we are looking to continue testing to higher stress. After completion of all testing, we utilize the Applied Superconductivity Center's extensive analytical and postmortem capabilities including composite imaging techniques and reel-to-reel characterizations to gain a deeper understanding of HTS cable mechanical limits and current-sharing in high magnetic fields. Additionally, we have developed plans with Advanced Conductor Technologies to test two CORC® Wire (cable diameter ~ 3 mm) wound solenoids of the same size as the Little Big Coils in the 31T DC Resistive magnet within an awarded user science proposal to demonstrate extremely high ramp rates (~1kA/s ~1T/s).

MAGNET SCIENCE AND TECHNOLOGY

The Magnet Science and Technology (MS&T) division advanced the NHMFL's mission in 2025 through significant progress across a broad portfolio of high magnetic field technologies. This year saw major strides in the design of the all superconducting 40T magnet and its developmental coil testing; successful fabrication of large, pulsed coils for the LANL 60T Controlled Wave and 100T multishot systems, design of the Large Bore Resistive Magnet (LBRM) and continued improvement in high strength, high conductivity materials essential for pulsed magnets. MS&T also maintained the DC Field Facility's suite of resistive magnets—including the world record 45T Hybrid and 41.5T all resistive systems—while launching major repair efforts on the 36T, 1ppm Series Connected Hybrid and the HTS REBCO insert of the 32T all superconducting magnet. In addition, the division completed development and fabrication of HTS REBCO insert coils for a commercial 25T all superconducting magnet, delivered to our partner Cryomagnetics in addtion to other collaborative projects. The sections that follow highlight these achievements in more detail.

1. DC Resistive Magnets

The 2025 Resistive Magnet Program has been marked by continued operational success, key maintenance milestones, and advancements in coil durability. The ongoing reliability of the suite of resistive magnets including the flagship 41.5T magnet ensures that the NHMFL remains a leader in high-field magnet technology, providing a stable and powerful platform for cutting-edge research. In addition, a 22.5T, 195mm large-bore resistive magnet design has been updated in detail in anticipation of starting construction and will be a key test bed to continue to expand our high-field user magnet capabilities to potentially 50T to 60T via high temperature superconducting (HTS) inserts.

i. Magnet Operations

The 41.5T all-resistive magnet, which has been in operation since 2017, continues to set performance benchmarks. In June 2023, the A/B-coil assembly was replaced after exceeding 2,000 hours at full field—nearly twice the typical lifespan of similarly stressed coils. Their replacement coils have since added another 2,060 hours of operation. In August 2024, the D-coil was replaced after an impressive 2,900 hours, further demonstrating the durability of these high-stress components. The outer C and E coils, which have been in use since 2017, remain operational with over 4,000 hours of service. As a result, the 41.5T magnet remains the most frequently used system in the DC facility in 2025.

ii. Maintenance and Coil Longevity Improvements

To ensure continued reliability, the MagLab carried out extensive maintenance and fabrication efforts in 2025. This included the production of four spare resistive coils and the completion of over 30 major maintenance actions, such as coil tightening, replacements, and scheduled interventions. A notable advance this year was the development of a new D-spare coil for the 41.5T magnet. By modifying the stacking pattern, the design maintains field strength while reducing current density, which is expected to enhance coil longevity. This innovation reflects ongoing efforts to improve the resilience and operational lifespan of resistive magnet technology.

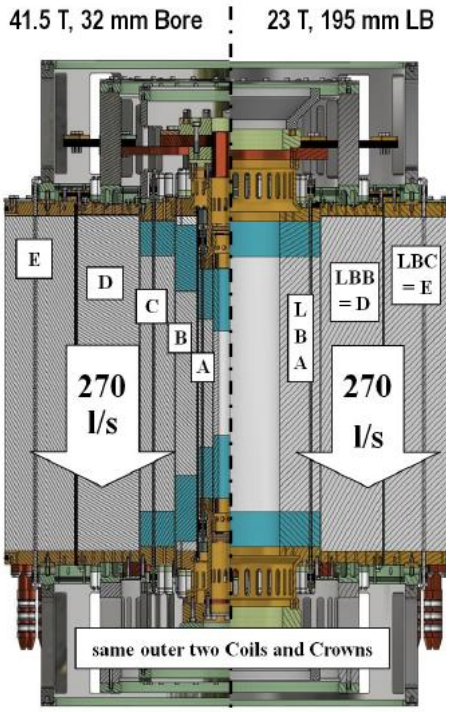

Figure 4.1.14 *The LBRM has three coils as shown in the right cross-section. The two outermost coils will copy the outermost coils of the 41.5T resistive magnet shown on the left side and the inner coil will be newly designed to achieve 22.5T in a 195mm clear bore.*

iii Large Bore Resistive Magnet (LBMR)

The LBRM design continued to advance to the point where construction can begin. The LBRM will be capable of generating a direct current (DC) magnetic field of 22.5T within a 195mm room-temperature bore. This will position the NHMFL to lead development in high-field magnet scientific discovery, crucial for pushing the frontiers of condensed matter science, nuclear magnetic resonance (NMR), and other high-field applications. Just as importantly, the LBRM will provide the high-field test bed to develop higher field HTS inserts that may ultimately achieve 50T to 60T. A program has been initiated where rapid development

of testing of HTS inserts will be performed in parallel with development of the DC field scientific techniques at these new higher fields. The present technology in large bore resistive or superconducting magnets worldwide peaks at lower fields, which are insufficient for the cutting-edge research anticipated. The magnet design utilizes Florida-Bitter disks, configured to maximize field strength while ensuring durability and reliability. As shown in **Figure 4.1.14**, two of the three coils directly use the design of coils in the widely used 41.5T resistive magnet and incorporate a new design of the innermost Coil A. The construction process will leverage NHMFL's extensive experience and existing infrastructure, ensuring a cost-effective and efficient design and construction process. Beyond its scientific contributions, the LBRM will enhance U.S. technological leadership in high-field magnet technology. It will provide critical infrastructure for developing next-generation high-temperature superconductors and their applications in various industries, including energy and healthcare. Furthermore, the project aligns with national goals for advancing scientific infrastructure and maintains NHMFL's position as a global leader in magnet technology research.

2. Pulsed Magnets

i. High Strength Conductor Development

In order to supply users with ultra high magnetic fields without interruption, we have been developing new technologies that can supply improved materials for maintenance of our magnets. In 2025, we continued to improve both fabrication technologies and characterization methods for conductors that are immediately required for user magnets.

In collaboration with our vendors, we developed several lengths of conductors for 60T CW magnet and for coils 3 and 4 of 100T outer coils. The conductors were made by GlidCop Al60 before our recent development. The Glidcop, however, suffered property control issues. We therefore developed CuCrZr. Both GlidCop Al60 and CuCrZr can be considered as composites. These composites are manufactured through thermomechanical processing, which introduces a high density of particles that act as obstacles to dislocation motion (**Figure 4.1.15**). An increased density of these particles enhances the mechanical strength of the conductors, which we tested under static loading in 2024 and 2025 (**Figure 4.1.16**).

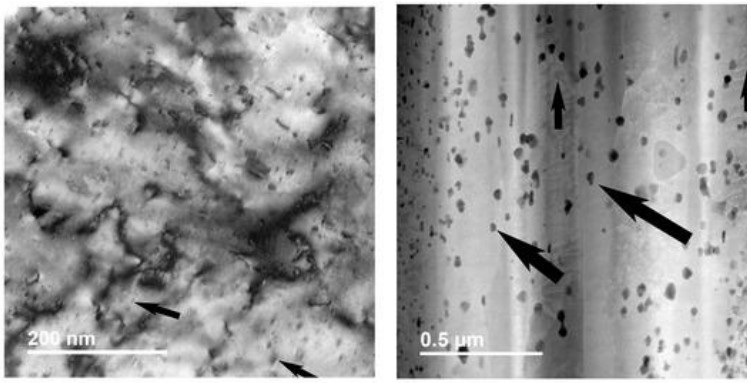

Figure 4.1.15 *Comparison of microscopy images of Cu strengthened by two types of particles: a. TEM image of a CuCrZr sample prepared by electron-polishing. Some strengthening particles are marked by arrows. Most nanosized particles are rich in Cr with a face-centered cubic structure. b. STEM HAADF image showing Cu-alumina prepared by FIB. Some alumina particles are marked by larger arrows. Most nanosized alumina particles are in the γ phase. Some dislocations are marked by small arrows. The sample is in wire form with the drawing axis perpendicular to the micron-bar in the images.*

Under certain conditions, such as cyclic loading, especially pulsed electrical mechanical loading, the conductors may either soften, harden, or even fail. Failure is likely to occur whenever the applied stress exceeds the flow stress of the conductors. Understanding and predicting the performance of conductors under cyclic loading can help MagLab scientists and engineers estimate the lifespan of any apparatus made from these conductors. The performance of conductors depends on whether the strengthening particles are characterized by ionic interatomic bonding (GlidCop) or metallic bonding (CuCrZr). During fabrication, we observed both the dissolution of particles (which added more solute atoms to the matrix) and the accumulation of dislocations. Because both solute atoms and dislocations tend to migrate at room temperature or higher, the complexity of microstructure changes increases in composites under cyclic loading. To minimize such complexity, we designed our test to determine fatigue properties at 77K, which is the temperature at which pulsed magnets operate. In 2025, we subjected the conductors to cyclic fatigue

tests using a load-controlled mode, the most commonly used mode in applications. We performed our tests primarily under asymmetric tension-compression cyclic loads, designed to produce higher absolute values for tensile loading than for compression. Throughout each series of tests, the relationship between tensile and compressive loads remained consistent from beginning to end. We tested each sample until failure, with most samples surviving more than 5000 cycles. The highest levels of plastic deformation strain appeared in each sample during its first half-cycle.

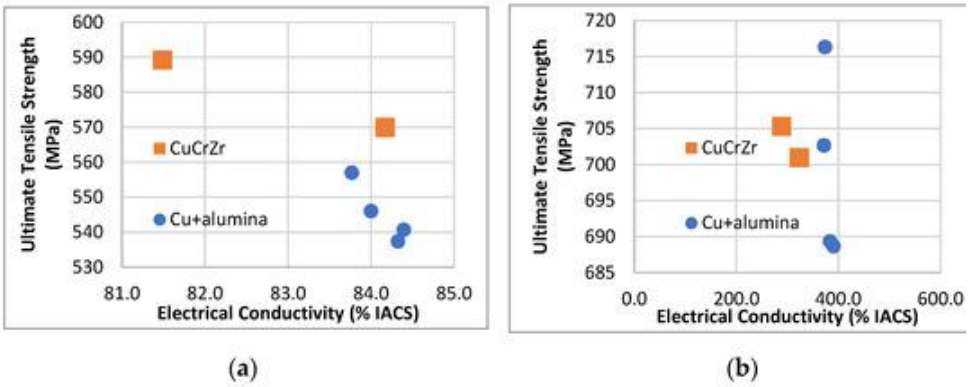

Figure 4.1.16 *Graphs showing ultimate tensile strength versus electrical conductivity for samples representing two types of composites. Each dot in the graph represents at least six tests for electrical conductivity and mechanical strength. Round dots represent Cu-alumina, and squares represent CuCrZr. a. Data obtained from tests performed at room temperature. b. Data obtained from tests performed at 77K.*

One of our tests was set for a tensile load of 643MPa and a compressive load of 211MPa, ensuring that (1) the stress amplitude level matched the average tensile strength and (2) the maximum stress level fell between the yield strengths of CuCrZr and Cu-alumina. Using dimetric strain measurements, we studied the differences in plastic deformation behavior under cyclic loading between CuCrZr and Cu-alumina. We found that the plastic deformation strain amplitude of CuCrZr at the end of the first half-cycle of loading was about 70% of that of Cu-alumina. At the end of the second full cycle of loading, the plastic deformation strain of CuCrZr was only about 50% of that of Cu-alumina. (Error! Reference source not found.).

In our second sequence of tests, we applied tensile and compressive loads of 643MPa and 243MPa, respectively. This maintained the maximum stress value from the first set of tests but increased the compressive load, raising the stress amplitude by 20%. Increasing the stress amplitude only marginally increased the strain amplitude. Although no significant difference was observed between CuCrZr and Cu-alumina after the first loading cycle, the plastic deformation strain of CuCrZr after the second cycle was about half that of Cu-alumina. After the tenth loading cycle, the plastic deformation strain of CuCrZr was just one-fifth that of Cu-alumina. Both sets of tests demonstrated that, under the same tensile stress level and stress amplitude used for cyclic tests, CuCrZr exhibited considerably less plastic deformation strain than Cu-alumina. The data indicates that, although the two types of conductors chosen for cyclic tests had almost identical mechanical strength at 77K, samples strengthened by ionic particles appeared to need larger plastic deformation strain so that they could accommodate the same magnitude

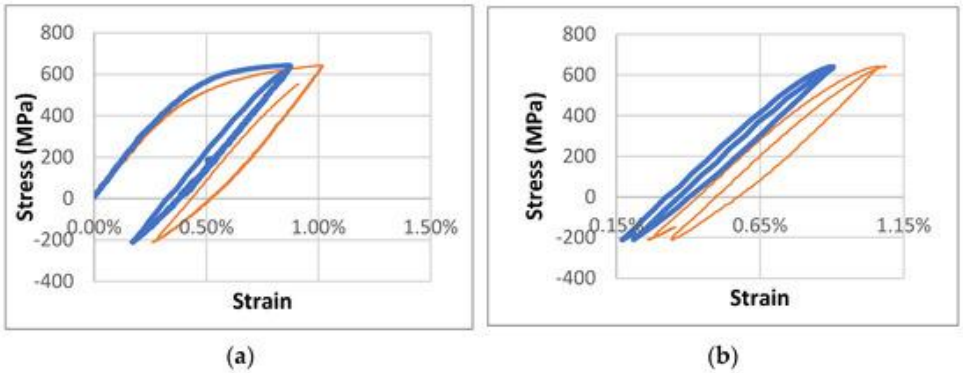

Figure 4.1.17 *Stress-strain curves at 77K for a Cu+alumina sample (thin orange solid line thick blue solid line) and a CuCrZr sample () under maximum load of 643MPa and minimum load of 211MPa. a. Comparison of curves during the first cycle. Plastic deformation strain amplitude values are ap-proximately 0.37% and 0.51% for CuCrZr and Al60, respectively. b. Comparison of curves during the second cycle. Plastic deformation strain amplitude values are approximately 0.08% and 0.16% for CuCrZr and Al60, respectively.*

of load as could be accommodated by samples strengthened by metallic particles, even though the latter had slightly lower UTS. This work sheds light on the reason why our new 65T short, pulsed magnet with improved design and conductors delivered more shorts than old 65T.

Although CuCrZr can be used for some magnets, other magnets require conductors with higher strength than CuCrZr. In 2025, we continue our effort in development of Cu-Ag-based composites, which are known for both high strength and high conductivity and are currently used at the MagLab as conductors in several resistive DC magnets. To reduce the cost, we studied Cu-Ag with addition of Zr, which can make the conductor perform with relatively low Ag content.

During the fabrication of these high strength conductors, surface defects are commonly generated. The evaluation of the surface defects can be done by notch sensitive tests. One question of particular interest is whether the stress concentration mechanism at notch tips is the same in Cu-Ag-Zr and GlidCop composites since Cu-Ag-Zr is composed of nano-lamellae but GlidCop is composed of Cu+alumina particles. So far, there is no knowledge about the influence of notches on the strength and plasticity of these conductors. Considering the high-strength Cu-Ag-Zr and GlidCop can be achieved in wire form, the notch sensitivity was studied and compared under both plane -strain and plane stress in this work. This study also provides an insight of the slot impact on the performance of the Cu-Ag used in DC resistive magnets.

We explored notch-related plastic deformation mechanisms in both Cu-Ag-Zr and Cu-alumina composites via real-time strain mapping. Experiments demonstrated that notch-strengthening occurred in both under plane-strain conditions. A large plastic strain was generated in localized deformation bands. The localized deformation band initiated from notch tips, developing into an ellipse band and bridging the opposite notch pair. With increasing notch tip radius, localized deformation bands gradually moved toward the notch segment center. Cu-Ag-Zr nanocomposites became notch sensitive under plane-stress conditions. High plastic strain areas are concentrated only at notch tips. Current results provide unique insights into the endurance and performance of high-strength nanocomposites.

GlidCop wires are strengthened by aluminum oxide ceramic particles. Strength reached only about 600 MPa. Cu-Ag-Zr wires, strengthened by nanoscale Ag fiber in Cu matrix, can achieve a strength level greater than 800 MPa. Despite the different

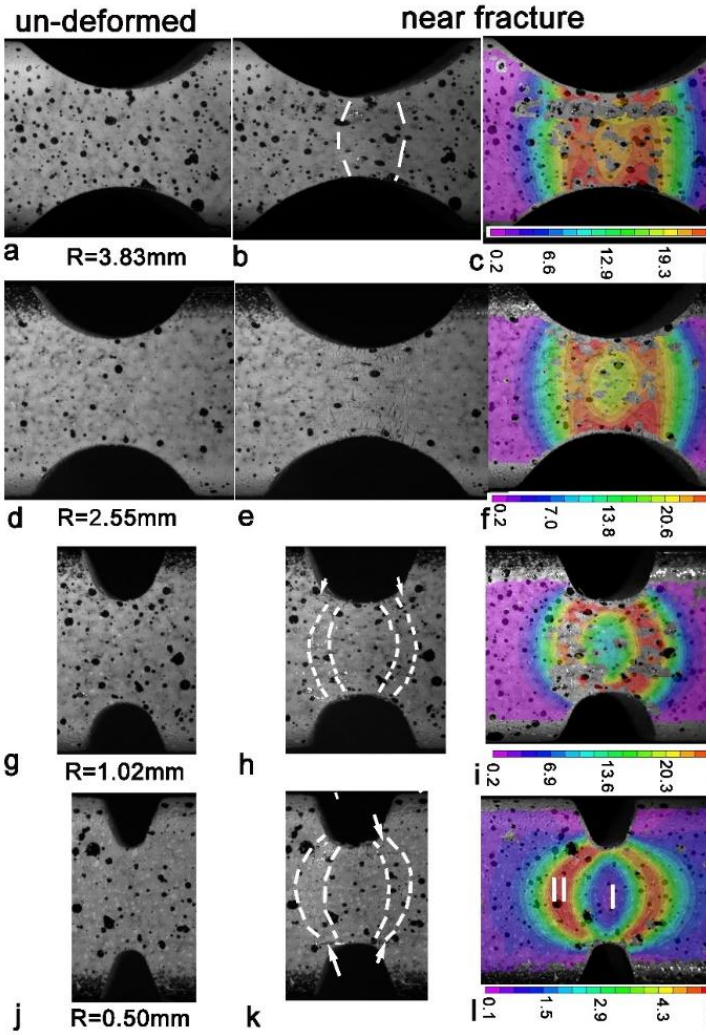

Figure 4.1.18 *Real-time observation of local plastic deformation and crack development in notched Cu-Ag-Zr samples. In (a), (d), (g), and (j), double-notched samples are shown before tension. The tension direction is along the horizontal direction. In (b), (e), (h), and (k), microcracks appear at the notch tip right before fracture. The white dash lines outline cracks and fractured locations. In (c), (f), (i), and (l), images show DIC strain mapping related to samples in (b), (e), (h), and (k), respectively. In (a-c), NTR=3.83mm; in (d-f), NTR=2.55mm; in (g-i), NTR=1.02mm, in (j-l), NTR=0.50mm.*

strengthening mechanisms and strength levels, we found that these two composites had the same notch-constrained deformation behavior.

The presence of double-edge notches in Cu-Ag-Zr wire changed not only the location of necking during the tensile tests, but also the strain magnitude within the strain-concentration area. In samples with large Notch Tip Radii (NTRs=3.83mm or 2.55mm), strain-concentration bands were concentrated in the segment center. Strain values differed very little between Zones I and II (We defined two deformation zones: Zone I, the inner island, was defined as the segment between notches; Zone II, containing the most deformed areas otherwise known as the strain-concentration bands, was characterized by a dense strain-gradient distribution. See **Figure 4.1.18** a-l). The values of elongation in the sample with NTR of 3.83mm were 48% in Zone I and 55% in Zone II, a difference of only 7%. In the sample with NTR of 2.55mm, elongation values were only 37% in Zone I and 45% in Zone II. In samples with small NTRs (1.02mm or 0.50mm), strain-concentration bands reached outward beyond the notch segment into the unnotched region, and the area of Zone I was larger in these samples than in samples with larger NTRs. Elongation values were smaller in samples with smaller NTRs than in those with larger NTRs. In the sample with NTR of 1.02mm, for example, the elongation values were 20% in Zone I and 33% in Zone II, which were respectively about 46% and 27% smaller than in samples with NTR of 2.55mm. The elongations in the sample with NTR of 0.50mm dropped further to 7% in Zone I and 27% in Zone II. Accompanying the plastic deformation in Zone II, many cracks appeared within strain-concentration bands. See **Figure 4.1.18** b, e, h, and k.

Deformation was NTR-dependent, not only in the plastic deformation regions but also in the nominal elastic regions (Zone I). In the elastic stage, the slopes on the stress-strain curves were 122±8 GPa, 137±5 GPa, 175±2 GPa, and 196±2 GPa at NTRs of 3.83mm, 2.55mm, 1.02mm, and 0.50mm, respectively. With an NTR of 3.83mm, the slope value was only 6% higher than the Young's modulus of Cu-Ag (115GPa). In the sample with sharp notch tips (0.50mm), the slope values (196±2 GPa) were almost twice as high as the Young's modulus of Cu-Ag-Zr. Based on these slope values, we deduced that Zone I of samples with sharp notches was subjected to much less stress concentration than Zone II of the same samples.

Cu-alumina exhibited no notch blunting under tensile deformation, while Cu-Ag-Zr showed significant blunting, indicating greater plastic deformation capacity. In unnotched samples, Cu-Ag-Zr wires demonstrated higher local plastic deformation in necked regions compared to Cu-alumina. In notched Cu-alumina, local elongation decreased rapidly with smaller NTRs, whereas in Cu-Ag-Zr, the decrease was notably slower.

These contrasting behaviors stem from microstructural differences. In Cu-alumina, pre-existing decohesion between alumina particles and the Cu matrix facilitated crack initiation, with notches accelerating crack propagation and connection, thus sharply reducing local elongation. In Cu-Ag-Zr, the realignment of Ag fibers mitigated the impact of notches, slowing the decline in local elongation. The notch insensitivity of Cu-Ag-Zr wires is attributed to their fiber-reinforced microstructure, which provides more malleable interfaces and greater flaw tolerance compared to the particle-reinforced Cu-alumina.

ii. Coil Fabrication

The Magnet Science and Technology (MS&T) division made substantial progress in advancing the MagLab's pulsed field capabilities through major fabrication efforts on two key highfield systems: the 60T Pulsed Magnet (Coil 7) and the 100T MultiShot Magnet (Coil 3). These accomplishments reflect significant gains in production efficiency, materials handling, coil engineering, and quality assurance—each essential for supporting world leading pulsed magnet science.

Together, the accomplishments on the 60T Coil 7 and 100T Coil 3 highlight MS&T's robust capacity for delivering complex, high precision pulsed field technology. These fabrication efforts directly support the MagLab's mission to provide the scientific community with reliable access to some of the highest pulsed magnetic fields in the world. By advancing production methods, improving tooling and facilities, and executing disciplined engineering workflows, MS&T continues to strengthen the laboratory's pulsed field infrastructure and ensure the long term vitality of the national user program.

60 T Pulsed Magnet – Coil 7: Fabrication of Coil 7 for the 60T pulsed system reached full completion this year, representing a major milestone in the ongoing upgrade of the LANL–MagLab pulsed field user program. The project spanned every phase of coil manufacturing, beginning with winding operations and concluding with final mechanical integration and shipment preparation.

MS&T completed the entire winding production, followed by successful execution of all conductor to lead transitions, including the leadout braze—a critical reliability step for high current, high dI/dt pulsed operation. Subsequent outer diameter insulation wraps and a carefully controlled vacuum impregnation

process ensured optimal mechanical consolidation and dielectric strength. After impregnation, the team installed exclusion plates and applied additional insulation layers to finalize structural reinforcement.

The coil was then inserted into its precision machined coil shell, after which all required facilities and tooling were configured to support the potting can assembly, epoxy transfer, and controlled epoxy cure. These steps together produce the rigid, monolithic coil structure needed to the withstand the extreme Lorentz forces generated during 60T operation.

Following cure, the MS&T team carried out a complete coil breakout, removing the can, exclusion plates, and mandrel while methodically eliminating all excess epoxy. They then conducted electrical testing and dimensional measurements to validate performance and dimensional compliance ahead of final packaging. The project concluded with installation of the lead supports and coil support bracing, fabrication of a custom shipping crate, and preparation of the unit for delivery to the pulsed-field operations group at the Los Alamos National Laboratory site of the MagLab.

Collectively, this work completes one of the major production coils for the 60T Controlled Waveform pulsed magnet system and supports long-term reliability for the laboratory's high-impact user program.

100 T Multi-Shot Magnet – Coil 3: Substantial progress was also achieved on Coil 3, part of the multicoil assembly used in the 100T MultiShot Magnet, one of the MagLab's most advanced pulsed field systems. This coil requires highly structured, multilayered fabrication processes to meet field quality, strength, and thermal management requirements.

The year began with preparation of the winding production setup, including wire inspection and cleaning, and installation of mandrel insulation and supporting assembly hardware. MS&T then configured and tested the taping machine, enabling precise placement of insulation throughout the winding sequence. With these preparations complete, the coil underwent full winding, beginning with the conductor lead-in, followed by a lead-in braze, insulation wrapping, and application of G10 fillers and guide structures to shape the first layer.

At each stage, the team installed transition G10 ramps, inner-layer insulation, and layer-to-layer dielectric barriers to ensure structural integrity and electrical uniformity. This entire cycle was repeated for four total layers, culminating in the leadout braze, final insulation wraps, and full outer-layer insulation.

Once winding and insulation were complete, the coil underwent vacuum impregnation, ensuring uniform resin infiltration into the winding pack. After impregnation, engineers inserted the coil shell and alignment pins, followed by installation of exclusion plates and final insulation reinforcements. The team also completed all necessary facilities and tooling setups and assembled the potting can, positioning the project for the next stages of cure and breakout.

This year's progress places Coil 3 well along the critical path toward final consolidation, machining, and eventual integration into the 100 T multicoil system.

3. Superconducting and Hybrid Magnets

i. 40 T all-superconducting magnet design

The 40T superconducting magnet preliminary and final design project is funded through the NSF Mid-Scale RI-1 program and was awarded to the MagLab in 2021 (Award number: NSF/DMR 2131790). The objective of this five-year project is to validate the high-temperature superconducting (HTS) technologies required for the 40T magnet and to complete the final design needed to advance to the construction phase.

The all superconducting magnet is required to generate 40T at the center of a 34mm diameter cold bore, with a magnetic field homogeneity better than 500ppm over a one centimeter diameter spherical volume. Once completed, the 40T SC magnet will be installed in the Millikelvin lab of the DC Field facility at the MagLab, near the existing 32T SC magnet. The 40T superconducting magnet will provide an ultra-low-noise environment for experiments lasting several days at a time – significantly longer than what is possible with powered resistive or hybrid magnet systems. Upon commissioning, the 40T SC magnet will become a flagship in the MagLab's suite of high-field user magnets, greatly expanding scientific capabilities for the User Community.

The paragraphs below highlight the achievements in 2025.

a. 40T superconducting magnet user survey

A guided survey was conducted within the user communities of DC field and Pulse field facilities. The goal is to engage users through established channels to prioritize high-impact experimental capabilities and to guide the development of experimental techniques that will maximize the scientific impact of the 40T

magnet. Superconducting magnets provide unique and unmatched performance advantages over resistive magnets, including long test times, lower noise levels, etc. Based on the survey results, the most requested instrument capabilities include higher magnetic fields, 10–20mK base temperatures with low electron temperatures, rapid turn around and fast field sweeps, in-situ sample rotation (1 and 2-axis), electrical transport measurements, thermal measurements, condensed Matter NMR, scanning probe (STM), optics(FTIR/THz).

To ensure these capabilities are available for the users when the 40T magnet transitions to operation, a suite of advanced user instruments is being planned for development and construction once the 40T magnet is approved for the construction phase.

b. Large Scale Coil 1 second round test

In 2024, the first round test of Large Scale Coil 1 did not produce desired results due to the issue of the HTS coil and instrument wiring. The coil was damaged during the quench tests. After the test, the LSC was rebuilt by replacing the damaged modules and a second round test of LSC1 was successfully performed in October 2025. This marks the successful completion of LSC1 and the milestone of the preliminary design completion is achieved. **Figure 4.1.19** shows the LSC1 being installed for the second round test.

Figure 4.1.19 *The LSC1 was being installed for the 2nd round test.*

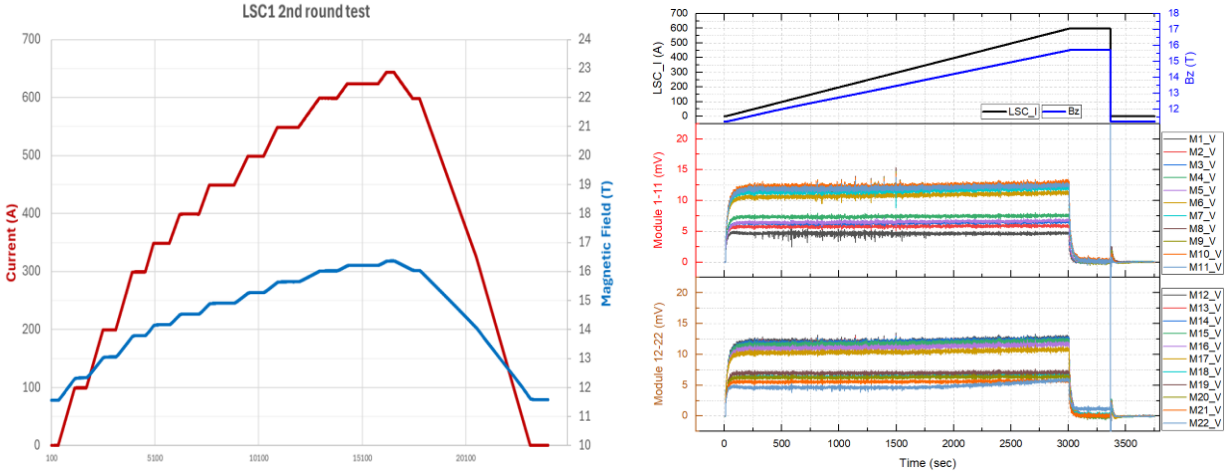

Figure 4.1.20 *LSC1 was ramped to its design current of 645A in an 11.4T background field (Left); The LSC1 was ramped up to 600A in an 11.2T background field at a continuous ramp rate of 0.2 A/s with no interruptions (Right).*

The second round test of LSC1 was a major success of the 40T project. The coil reached the target operating current in the first run. Then the quench protection system for the coil was tested by repeatedly firing the protection heaters with the coil energized. The protection system performed well with no observable degradation of the coil. An internal review was held to fully review the test results. The key accomplishments of the LSC1 2nd round test include:

1. Achieved the designed operating current of 645A in a background field of 11.4T, shown in **Figure 4.1.20,** corresponding to 70% of the critical current. This is the very first time for such a large HTS coil to reach this ratio of I_{op}/I_c.
2. Demonstrated required ramp rate of the HTS coil, shown in **Figure 4.1.20**.
3. Verified HTS coil quench protection through repeated quenches at various operational currents (I_{op}): 600A (twice), 584A, 560A, 540A, 495A, 445A. No observable degradation was observed during the tests. **Figure 4.1.21** shows the quench behavior of LSC1 at 445A and 600A.

4. Validated the design and analysis methodologies for the HTS coil.
5. Generated extensive benchmarking data for HTS coil design codes, including quench simulation, heater design, and electromagnetic structural analysis.
6. Demonstrated the quench detection CRIO system with the improved logic for filtering the voltage noises, shown in **Figure 4.1.22**.
7. Confirmed that the insulation is adequate to withstand high voltage during quench events.
8. Demonstrated the high magnetic field quality can be achieved through effective field control.

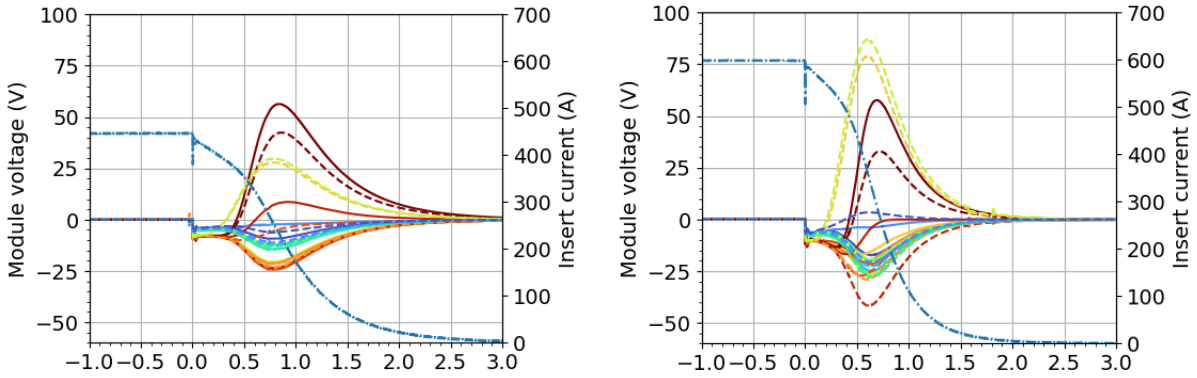

Figure 4.1.21 *Quench test of LSC1 at an operating current of 445A (left) and 600A (right). The dotted blue line is the current in the HTS coil. The solid and dash lines are the module voltage.*

After the test, the coil was warmed up and disassembled for visual inspection for damage. Several issues were observed on the inner crossovers (innermost turn transition from one pancake to the other within a module) and the crossovers at the outer diameter and the lower terminal. They were caused by the coil motion, which is inherent to dry-wound HTS pancake coils. Their design will be improved to prevent damage to the inner crossovers (innermost turns) and enhance the reliability of outer crossovers and terminals. These issues will be addressed and further validated in the next Large Scale Coil LSC2.

c. 40T magnet design

We continued refining the design of the 40T HTS magnet to ensure it meets all the design criteria and incorporates the lesson learned in the test coils. The preliminary design has been completed and it includes the following key features: Three HTS coils contributing a total of 28T, use of I_c-graded conductors, maximum operating current ratio (I_{op}/I_c) limited to ≤ 0.6, the copper current density is < 770A/mm^2, the maximum hoop strain ≤0.45%, the voltage to the ground ≤ 1kV during quench, and a peak quench

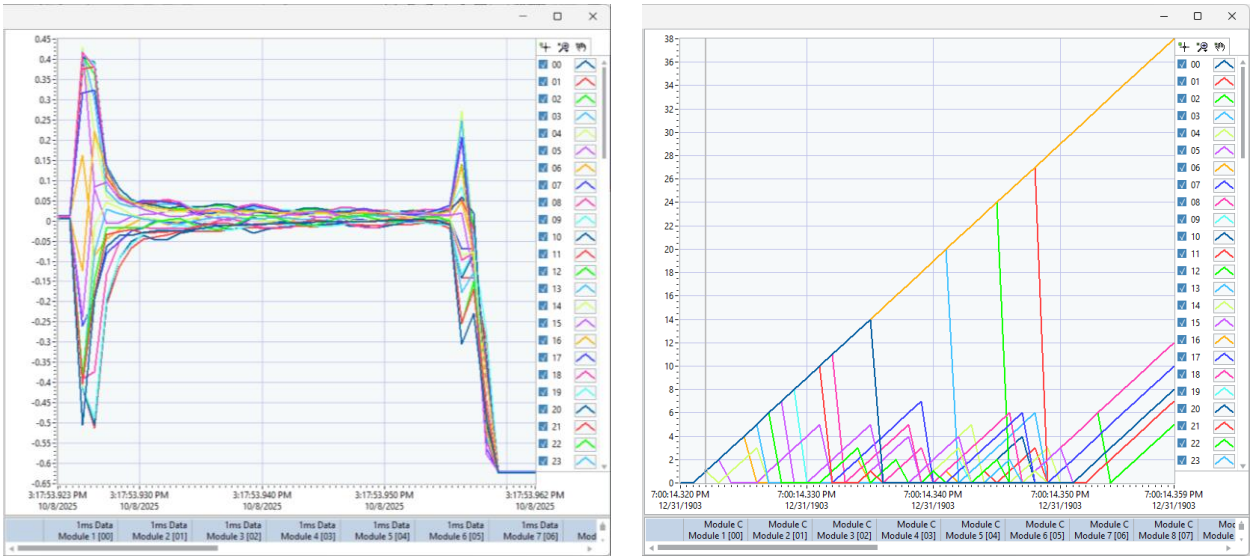

Figure 4.1.22 *Module voltage signals triggered a quench at 445 A (left), Counters of the voltage over the quench detection threshold (Right). When the counter was over 30, the quench project was triggered as intended.*

temperature not exceeding 250K. Two major design modifications were implemented based on the lessons learned in the test coils: (1) increasing the thickness of the co-wound reinforcement to address the low winding compressibility in the modules, and (2) increasing the heat flux from quench heaters to improve the quench protection at low operating currents.

The full 40T magnet includes a 12T LTS outsert, combined with the HTS coils to reach a total field of 40T. The initial specification for the LTS magnet was released to the vendors as a Request for Information (RFI) for the 40T construction proposal. Two vendors responded with conceptual LTS designs and estimated budget and schedule. The specification requires a fringe field of 10 Gauss at a radius of less than 2 m, achieved through superconducting shield coils. Based on the vendor's conceptual design, construction of an LTS magnet with shield coils meeting the specification appears feasible and the technical risk associated with the shield coils is lower than originally anticipated. The cryostat dimensions are compatible with installation in the PIT for the 40T magnet in the Millikelvin lab. We will continue working with the vendors, who will provide revised timeline and budget estimates once the submission deadline for the 40T construction proposal is confirmed by the NSF.

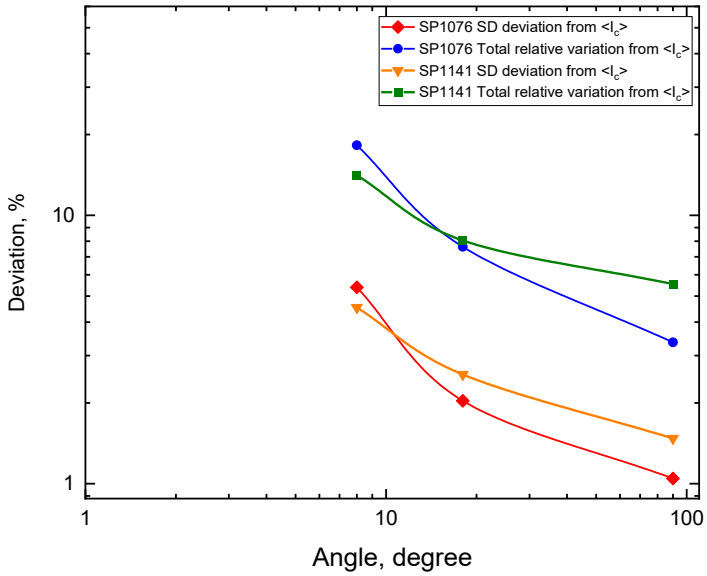

Figure 4.1.23 *Comparison of Ic variation along the length between edge slit tape (SP1141) and mid-slit tape (SP1076).*

ii. REBCO conductor test

We continued testing the REBCO conductors received from SuperPower to track the performance of their production tape.

We investigated the performance uniformity of long length REBCO tapes along their entire length. For this study, an edge-slit tape of 120m long (SP1141) and a mid-slit tape of 81m long (SP1076) were selected. REBCO tape is typically manufactured as a 12mm wide strip, which is subsequently slit into three 4-mm-wide tapes. The two tapes taken from the edges of the original strip are referred to as edge-slit tapes. The tape taken from the center is referred to as mid-slit tape.

The results show that the transport I_c(4.2K, 14T, 18 °) through the length of both tapes SP1141 and SP1076 exhibits acceptable variation of 10%. Analysis of the REBCO layer thickness based on SEM images indicates that thickness fluctuations do not contribute significantly to the observed I_c variations. Additionally, sample-to-sample differences do not appear to arise from variations in pinning properties.

A comparison between edge slit and mid-slit tapes shows that overall transport current deviations at various angles are roughly similar. At smaller field angles, the Ic values exhibit relatively larger variation, which may be attribute to the higher sensitivity of angular dependence at small angle, shown in **Figure 4.1.23**.

We also tested four samples of the REBCO tapes manufactured using the newly installed M6 and M7 production lines at SuperPower. The two new machines are intended to significantly increase the vendor's production capacity. The samples consisted of two AP (Advanced Pinning) tapes and two HM tapes (recently developed for use in high magnetic fields). Based on the test results, we observed no major differences between tapes produced on M6/M7 and those manufactured on the older machines M3 and M4. Overall, the tape produced on the new equipment is acceptable for use in the 40T project.

During 2025, we ordered a total of 5,000 meters of REBCO conductor, including both standard and graded critical current (I_c) types. Approximately half of the purchased conductor has been delivered. Upon receipt, we performed a series of Quality Control (QC) tests including transport-based I_c measurements at various angles, I_c vs. angle characterization using magnetometry, Residual Resistivity Ratio (RRR) of copper, ab-tilt angle, joint resistance testing, peel strength, and cross-sectional analysis. These conductors are intended for use in the LSC2 (Large-Scale Coil 2).

We also completed the draft specification of REBCO conductor for use in the 40T magnet and discussed it with the vendor. Because the 40T HTS coil design is still evolving, the specification will be finalized after the final design of the magnet is complete.

40T construction proposal

In anticipation of submitting the 40T construction proposal under the mid-scale RI-2 program in 2025, we started planning for the construction in Q4 2024 and completed the draft plan early 2025. However, due to delays in the release of the next round RI-2 program solicitation, the proposal has not yet been submitted. In the meantime, we are continuing work on the final design of the magnet and developing the project execution plan for the construction phase, while awaiting the official solicitation. The delay of construction proposal will cause a funding gap for the 40T project between the completion of 40T design project and the start of the construction project. This funding gap issue has been actively communicated with the NSF program officers and the MagLab leadership.

Numerical Models–Radial Compliance

A notable accomplishment was the development of a numerical model to simulate radial compliance in REBCO wound coils. The magnet community recently observed that tape-wound coils exhibit high compressibility in wound coils. This greatly impacts the computed strain if not accounted for in modeling. A finite element model utilizing contact elements was developed here that includes the actual REBCO tape profile which are quite nonuniform. **Figure 4.1.24** is a schematic of a REBCO tape showing how a nonlinear penalty function in the contact elements is applied to approximate a nonuniform surface geometry.

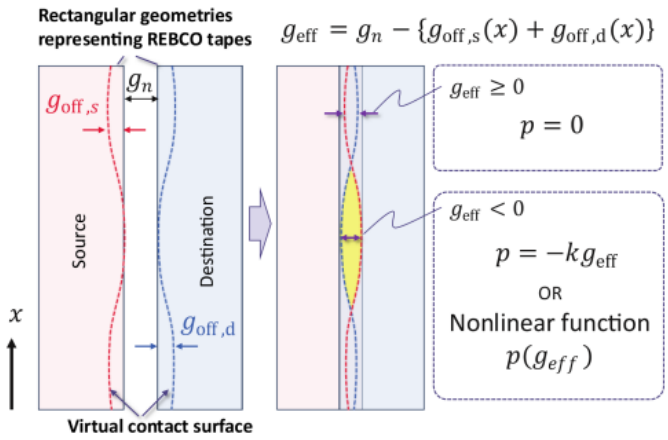

Figure 4.1.24 *Modeling nonuniform REBCO tape surface utilizing a penalty function.*

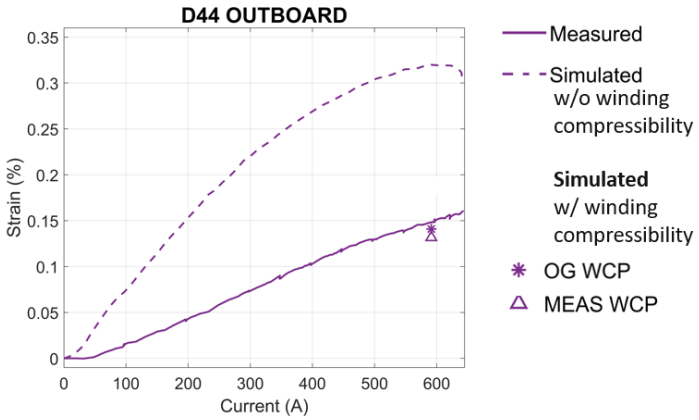

Figure 4.1.25 *Comparison of measured and computed strain using various methods showing that compressibility (symbols) agrees best.*

Numerical Models – Structural

The structural models are verified by benchmarking with testing. The LSC round 1 and round 2 tests provided ample data from the strain gauge instrumentation that were attached to the coils. The comparisons will help determine the most appropriate model moving forward, see **Figure 4.1.25**.

Numerical Models – Quench

To protect superconducting magnets from thermal and electrical damage caused by the sudden loss of superconductivity (quench), coils are actively protected utilizing embedded heaters that are powered to normalize as much as the coil mass as possible to safely distribute the energy. The heater design has been improved from a radial pattern to an orthogonal pattern that increases the number of peak hot zones. A sample of a heater temperature profile is shown in **Figure 4.1.26**. Three-dimensional modelling of the heaters is done to estimate the thermal heat flux applied to a coil and the resulting temperature increase. These results are used in conjunction with quench modeling.

The modeling of quench is highly complex, and the results often have a high degree of uncertainty, primarily due to the variability in the mechanical properties of the superconductor. The confidence level of the results has been greatly improved now by applying the Monte Carlo method that provides a statistical representation of the outcome from quench. Thousands of computations are performed to give a range of likely voltages and temperatures from a quench event, as shown in **Figure 4.1.27** for the Large Scale Coil (LSC).

Development of high voltage during quench is a fundamental issue with large solenoids. This has been shown to be apparent in the redesign of the 32T all-superconducting magnet. The quench protection circuit used in the original 32T design cannot keep the voltages to an acceptable level with the new magnet design. Analysis shows, however, that the inclusion of a diode placed across the coils allows currents to redistribute away from the high resistive zones, reducing the voltages.

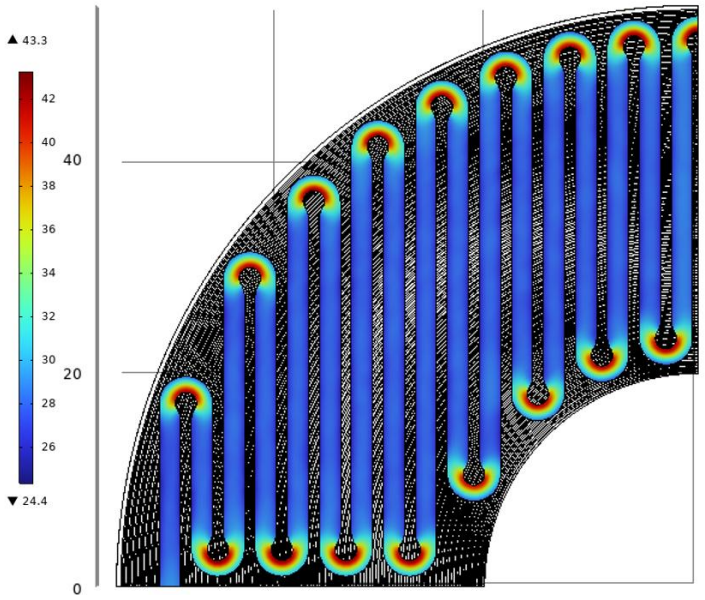

Figure 4.1.26 *Simulation of temperature across an orthogonal geometry quench heater.*

Numerical Models – Coupling Currents

Another potential issue is coupling currents that exist between stacked superconductors. The 40 T design includes a two-in-hand winding of REBCO tapes. The distribution of currents between these two tapes as the coil current ramps, has been unknown. Through the use of H-phi formulation, a picture of the current distribution is appearing. It does show that from normal ramping up and down, the current distribution has little effect on the overall performance of the magnet. A quench event however creates rapid current changes and very dynamic current flow between tapes. Simple modeling shows that current will flow in opposite directions which is an interesting phenomenon. The study will continue by coupling the simulation into a quench model.

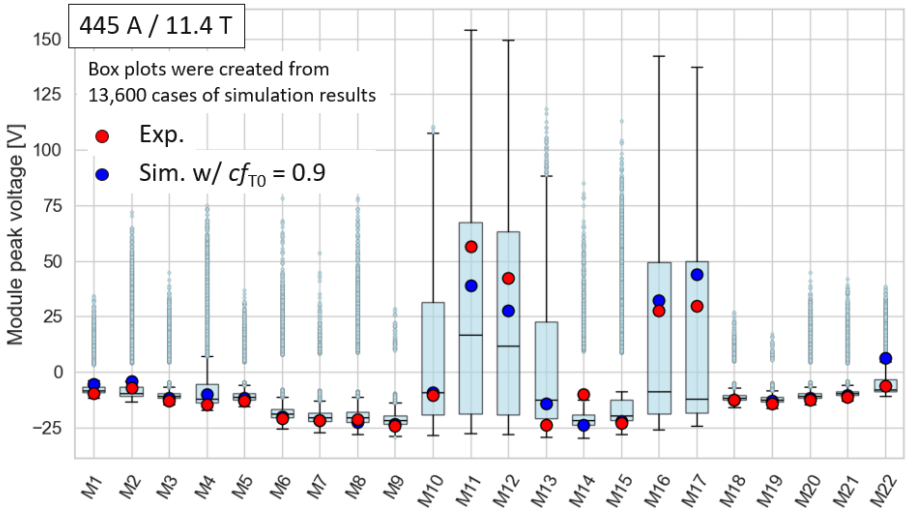

Figure 4.1.27 *Measured peak voltage in each module of the LSC with Monte Carlo simulation results overlaid.*

iii. 36 T Series-connected hybrid 20 kA lead repair

In March 2025, the MagLab initiated a project to replace the 20kA binary current leads on the Series-Connected Hybrid magnet after the leads were damaged as shown in **Figure 4.1.28** during a test run on January 15, 2025.

At the project start, a work plan and cost estimate was generated using worst case assumptions, including the need to remove the vacuum vessel from the SCH magnet and to replace the HTS section with REBCO tape. The initial project duration was estimated to be 2.5 years.

An access panel on the vacuum vessel near the leads was provided in the original design. There was a risk that the leads could not be disconnected through the panel opening and that a more complete diasassembly of the magnet would be required. Once the panel was removed, we learned that we could access the leads through the panel, and that risk was retired. The leads were removed in June without disturbing the helium circuit. The nitrogen circuit was capped off and a temporary hatch was installed.

Figure 4.1.28 *View of the blue SCH current leads after access panel was removed. The damaged section can be seen by the disolored section on the right 20 kA lead.*

A Root Cause Analysis was performed by a team of investigators from Fermilab. The team visited the MagLab in July to conduct interviews and collect data. A report was drafted shortly after the visit. After reviews with MagLab personnel, a final report was released in November.

The report identifed four causes including insufficient cooling, improper protection and failed sensors. The report made eight recommendations, to improve temperature, voltage, liquid nitrogen level and nitrogen gas flow sensors, to improve procedures for startup and operation of the magnet, and for corrective improvements to the protection system. The report recommended replacing the damaged HTS section with the same Bi2223 conductor that was originally used.

Concurrently with the Root Cause Analysis, a conceptual design for a replacement current lead using REBCO conductors was conducted. The original material used for the HTS section was Sumitomo Type G, a 4 mm width tape made of a silver/gold alloy matrix with Bi2223 filaments. This material is no longer manufactured and our initial queries indicated that none was available.

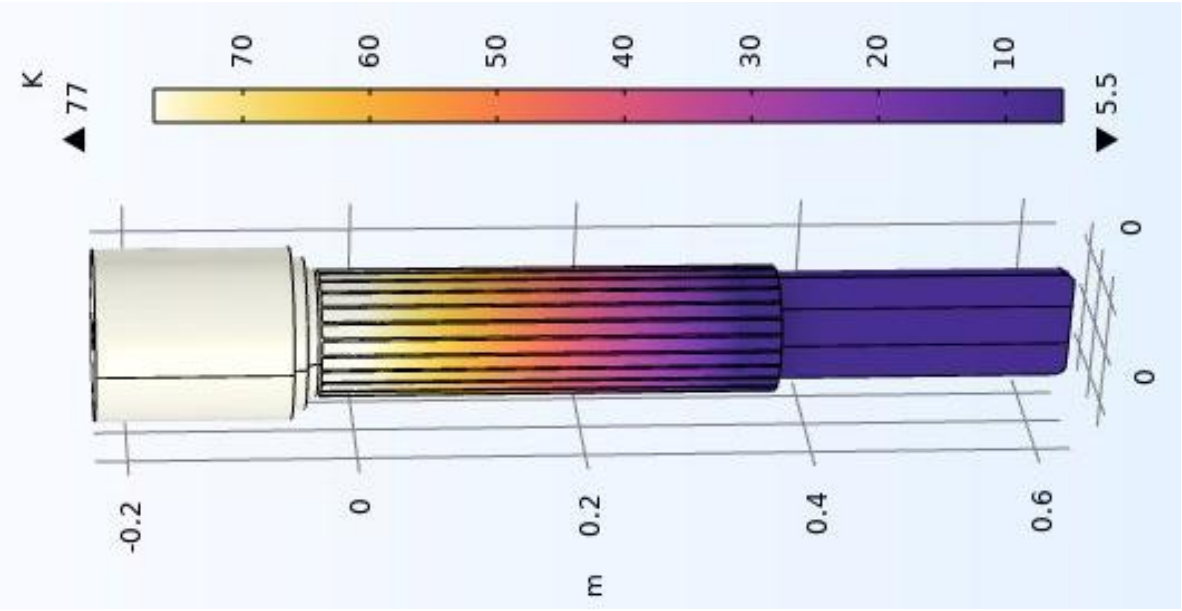

Figure 4.1.29 *SCH lead temperature profile used to compute the heat load on the REBCO lead design.*

The only option at the time was to reconfigure the HTS section of the SCH leads to use REBCO tape. A feasible REBCO design was found after analysis, design and prototyping was done to define a suitable configuration. The proposed lead specified 12mm width REBCO tape from Faraday Factory, stacked and soldered to a brazed assembly configured to be a drop-in replacement for the HTS section in the original lead.

The critical current temperature dependance of REBCO limits its capability and thus detailed knowledge of the temperature distribution during operation is vital. Three-dimensional modeling has been done to enable designers to better determine the number of required REBCO tapes and their distribution around the lead. **Figure 4.1.29** shows the temperature distribution between the nitrogen reservoir and 4.2K end of the SCH lead.

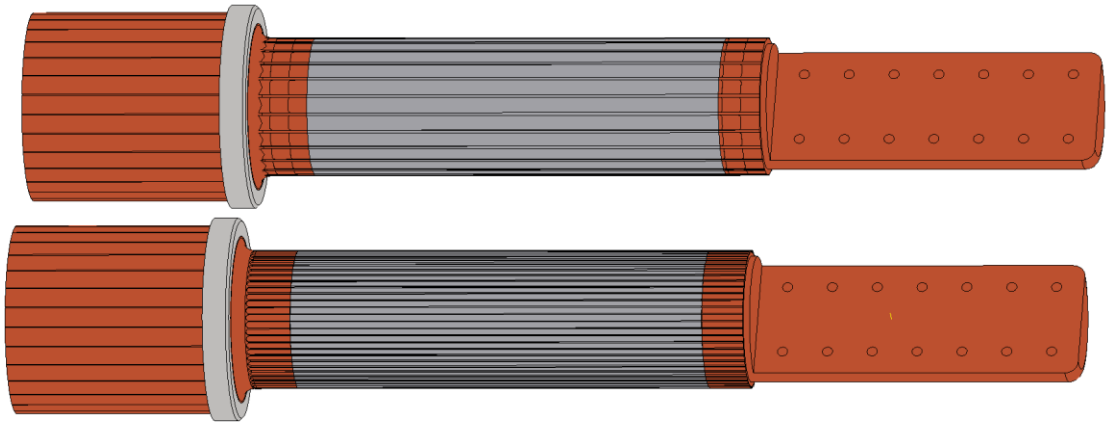

Figure 4.1.30 *HTS sections compared. Original Bi2223 design at bottom, REBCO design option at top. The REBCO design uses 24 stacks of 12mm width tape. The original design uses 60 stacks of Bi2223 tape.*

In November, we learned that CERN has a reserve supply of Sumitomo Type G conductor. They agreed to provide the MagLab with enough tape to repair the damaged lead. The project plan was revised to inactivate the tasks of disassembling and reassembling the magnet, and to develop a new HTS section design using REBCO tape. New tasks were added to replace the damaged Bi2223 tape with new and identical tape provided by CERN. **Figure 4.1.30** shows the initial drop-in replacement of the REBCO conductor, now abandoned due to the location of Bi2223 inventory, in comparison to the original lead design.

iv. 32 T rebuild

The rebuild of the 32 T HTS Insert has begun. Approximately 20 design iterations have been performed taking into account design decisions such as single vs. two-in-hand REBCO turns, grading of REBCO for different fractions of critical current, specifying center vs. edge-cut REBCO, different copper current densities using integral vs co-wound copper, thickness of co-wound stainless steel, different reinforcing concepts, grading of quench heaters, specifying diodes in the quench protection circuit and whether to use other HTS materials besides REBCO. These strategic design decisions affect stress and quench risk versus field and cost tradeoffs. Design developments and test coil performance made on the 40 T all-superconducting magnet design phase were leveraged in these decisions, and vice versa, the developments made in the design iterations and analyses made on the 32 T rebuild will be leveraged on the 40 T all-superconducting magnet project. As shown in **Figure 4.1.31** the final conceptual design meets the quench requirements of maintaining insert coil temperatures to less than 220 K and voltages to ground to less than 750 V.

4. Collaborations

Commercial collaborations were active this year with Cryomagnetics, Mevion, Type One Energy, Brookhaven National Laboratory, Commonwealth Fusion Systems, Rolls-Royce, General Electric and Lawrence Berkeley Laboratory. HTS insert modules using epoxy impregnated REBCO modules were designed, fabricated and tested for Cryomagnetics as the HTS insert for their commercial development of a 25T all-superconducting magnet. Cable testing was performed in the 12T split superconducting magnet

for Mevion's Proton Therapy machines. HTS cables are being developed at Type One Energy for the Fusion Energy device which will also be tested in the 12T split magnet. Mechanical testing was performed at 4.2K for Commonwealth Fusion Systems. Physical properties at low temperatures were performed on materials for Rolls Royce. Thermal expansion of materials at low temperatures were performed for General Electric. And finally, an Ic test probe design was advanced for Lawrence Berkeley Laboratory.

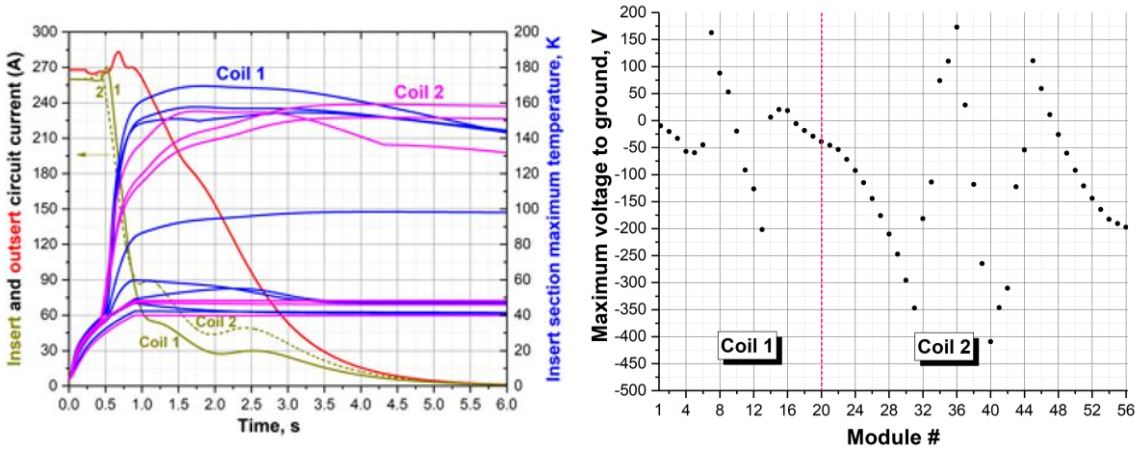

Figure 4.1.31 *The rebuild of the 32T HTS Insert has begun starting with updating the HTS Insert design incorporating the technology development on the 40T all-superconducting magnet design project. The quench analysis shows that the design meets the requirements of maintaining temperatures less the 220K (left graph) and voltages to ground less than 750V (right graph).*

4.2 CENTER FOR FAIR AND OPEN SCIENCE

INTRODUCTION

The MagLab's Center for FAIR and Open Science (CFOS) long term goal is to ensure that all products of research generated at the MagLab are shared according to the principles of FAIR data[1] and open science (FAIROS). The FAIR principles provide guidance for ensuring that research data are findable, accessible, interoperable, and reusable by both humans and machines while also emphasizing qualities that enable its reproducibility, integrity, and transparency. The FAIR principles also facilitate readiness for artificial intelligence (AI) applications. These goals closely align with the NSF's Strategic Plan[2] which emphasizes Gold Standard Science and the importance of advancing innovation through the development and implementation of AI.

Making data FAIR and open is recognized by both the United States federal government and a broad array of intergovernmental organizations as being essential to accelerating the pace of innovation and making the social and economic benefits of science available to all. To do this CFOS develops regulations, policies, and recommendations on FAIR and open science for all users, including both instrument users who directly utilize magnet systems and data users who access MagLab datasets through public access repositories such as NSF-PAR. The National Science Foundation's (NSF) Public Access Plan 2.0[3] and related provisions in the current Proposal & Award Policies & Procedures Guide[4] are the primary guiding documents used in this process, but documentation and best practices from across the fields of science and engineering are also considered. CFOS also works to address challenges associated with the intersection of information assurance with data management practices. The implementation of measures to make data FAIR such as persistent identifiers (PIDs) for researchers and data indexing systems that allow the tracking of research data provenance also have important implications for research transparency, integrity, and resilience.

CFOS recognizes technical and cultural challenges within the disciplines of research practiced at the MagLab that complicate the adoption of FAIR and open data sharing practices. CFOS addresses these challenges by providing knowledge and tools to users that simplify the process of implementing FAIROS, working towards making it an integral and seamless part of the research experience. CFOS staff also participate in research community organizations to help drive the development of solutions to the implementation challenges that MagLab users face.

USER SUPPORT

MagLab users face a growing complexity in applying FAIROS to their work. Recently, data sharing policies from funders, publishers, and institutions began to recommend that products of research, including the raw data underlying the research findings, be made immediately and publicly available upon publication (or other dissemination). With recent supplements to the NSF's PAPPG, this has become obligatory for MagLab users. CFOS aims to ensure that users have access to tools and knowledge that minimize the time investment required to meet these requirements and maximize the value derived from applying FAIROS principles.

In 2025, CFOS provided support to MagLab users in a variety of ways. Data management and sharing plans (DMSPs), primarily based on guidance from the NSF Division of Materials Research, are available in a centralized location on the MagLab website to ensure their accessibility for users. DMSPs are available for the MagLab as a whole and for each user facility, providing users with details specific to their discipline of research. CFOS personnel also assisted MagLab personnel by writing/reviewing DMSPs for grant proposals submitted to NSF.

MagLab users also received direct support from CFOS and affiliated MagLab staff in meeting sharing requirements for data, publications, software, and other products derived from their use of MagLab resources. The MagLab maintains its membership to Open Science Framework (OSF), a generalist open access repository that allows users to upload and share their work. Research products can be associated with metadata and assigned PIDs to enable their findability and meet sharing requirements for their work. In the MagLab's Pulsed Field Facility (PFF), CFOS-affiliated staff Lyudmila Balakireva and Fedor Balakirev provided specialized tools that allow PFF users to automatically upload data and metadata collected at the facility to OSF, providing a convenient means of access to user-acquired data and simplifying the process of data sharing.[5]

In the future, CFOS will continue to provide up-to-date guidance and on-demand support for MagLab users. Recently-released supplements to the PAPPG that mandate public data sharing and public availability of journal articles and other materials through NSF-PAR will require the MagLab to modify its long-standing user program policies and users will need to adopt new practices to ensure compliance. CFOS is ready to provide guidance to users in implementing new data and publication sharing practices and ensuring that appropriate persistent identifiers are associated with all products of research.

FSU COMPUTER SCIENCE COLLABORATION

In 2025, the collaboration between the MagLab's Ion Cyclotron Resonance facility and Florida State University's Computer Science (CS) department continued and reached significant milestones. MagLab and CS faculty submitted grants to the NSF's Information Integration and Informatics (III) and Programmable Cloud Laboratories (PCL) solicitations, both focusing on the use of AI to enable advanced data acquisition and analysis capabilities for MagLab users. Additional grant submissions will be pursued in 2026.

The MagLab also provided funds for a CS student mentored by David Butcher and Zhenhai Duan from FSU CS to collaborate with the Cornell High Energy Synchrotron Source to incorporate their CI solutions – details are provided below. These faculty also mentor an additional graduate student working on the implementation of AI-based de novo sequencing algorithms for proteomics data acquired using ICR facility instrumentation.

CHESS COLLABORATION

The MagLab has long sought collaborations with other FAIROS efforts, particularly those related to the development of critical CI to enable FAIR and AI-ready data. During a workshop held by CI Compass in early 2025, a connection was established between CFOS and staff at the Cornell High Energy Synchrotron Source (CHESS) working on a suite of services for data and metadata management called FOXDEN. CFOS formed a collaboration with CHESS staff to implement these same services at the MagLab, providing the necessary CI to implement FAIROS.

CHESS and CFOS staff, including a CS graduate student hired to work on the project, have worked on integration of FOXDEN at the MagLab and development of an application to facilitate generation and management of metadata for datasets collected at MagLab user facilities. In 2026, the application will be tested in the Ion Cyclotron Resonance facility. Lessons learned from this initial implementation will be used to guide further development, with the goal of enabling advanced metadata management across all user facilities.

COMMUNITY OUTREACH AND EDUCATION

A key barrier to implementing FAIROS is the lack of solutions — especially adequate cyberinfrastructure (CI) and widely accepted data and metadata standards. Advancing FAIROS across science and engineering requires broad, coordinated community participation. Numerous recent initiatives foster coordination within and across disciplines. CFOS engages in these efforts to keep the MagLab aligned with best practices and to advocate for its users.

Association of Biomolecular Resource Facilities Annual Meeting

In March of 2025, CFOS staff participated in the annual conference of the Association of Biomolecular Resource Facilities (ABRF), giving a presentation and participating in a panel on the challenges faced by regional and national core facilities. The contributions of CFOS staff focused on data management challenges, specifically related to data management, cyberinfrastructure, and meeting public access requirements. The members of the panel, led by Thayumanasamy "Soma" Somasundaram, an FSU faculty member in the Institute of Molecular Biophysics and Director of FSU's X-ray Crystallography Facility, later collaborated on a publication in the ABRF's Journal of Biomolecular Techniques entitled "Regional and National Shared Research Resources: Challenges and Opportunities."

CI Compass Collaborations

In 2025, CFOS continued its collaborative efforts with CI Compass, the NSF Cyberinfrastructure Center of Excellence, to develop strategies for implementation of new CI at the MagLab. The mission of CI Compass is to "provide expertise and active support to CI practitioners at NSF Major Facilities in order to accelerate the data lifecycle and ensure the integrity and effectiveness of the CI upon which research and discovery depend." This support has been critical to helping the MagLab advance its plans for implementing FAIROS practices, particularly by forming new connections with other NSF-funded facilities and initiatives to develop and implement critical cyberinfrastructure components such as persistent identifiers (PIDs).

CI Compass FAIR Workgroup

In addition to supporting major facilities, CI Compass maintains a FAIR Working Group that brings together CI professionals and major facility staff to discuss FAIR data implementation at major facilities. Throughout 2025, the Working Group met regularly to discuss the latest innovations in CI and data management to facilitate FAIROS, including new standards for the representation of data and metadata and the facilitation

of knowledge network construction and generating data ready for exploitation AI. These discussions helped to facilitate new connections with groups working on solutions for FAIROS. In 2026, CFOS will continue to meet and discuss concrete implementation of CI concepts developed in collaboration with the Working Group and as part of the continued collaboration with FSU's CS department.

CI Compass Fellowship

In 2024, the MagLab hosted a student through the CI Compass Summer Fellowship program. The student was hosted in on-campus housing at FSU and worked with MagLab faculty member Julia Smith on a project that used machine learning to analyze audio recordings of instruments to predict magnetic coil failures and prevent costly and disruptive damage to magnet systems. The success of this fellowship has encouraged the MagLab to continue its participation. In 2025, the MagLab agreed to support up to two fellowship students placed by CI Compass for the summer of 2026. Students will be directly involved in the development of critical CI for the generation and cataloguing of metadata for MagLab experiments, helping the lab to meet its goals for FAIR and AI-ready data.

FAIROS RCN: Fair Facilities and Instruments

The NSF's Findable Accessible Interoperable Reusable Open Science Research Coordination Networks (RCN) program was granted in 2022 with the goal of fostering catalytic improvements in scientific communities focusing on the FAIR principles. In 2025, the third annual meeting of the FAIROS RCN for FAIR Facilities and Instruments was held at the National Center for Atmospheric Research in Boulder, Colorado. Data management and cyberinfrastructure professionals from universities, major facilities, and non-profit organizations across the country convened in Boulder to discuss a variety of subjects, including the implementation of PIDs for facilities and instruments. This year's meeting included extensive discussion of the progress made over the last few years of the RCN. The co-PIs of the RCN published a workshop report[6] and an additional set of recommendations[7] as a capstone on the three-year RCN project, which incorporates hundreds of hours of discussion among dozens of experts and will serve as a valuable resource for future implementations. Implementation of Persistent Identifiers for Researchers

IMPLEMENTATION OF PERSISTENT IDENTIFIERS FOR RESEARCHERS

The implementation of PIDs for researchers will be critical to the implementation of research security requirements, providing authenticated access for users of MagLab systems, and tracking the products of MagLab research. In 2025, CFOS continued the process of obtaining an ORCID membership for the MagLab. The process has been delayed by contract negotiations between FSU and ORCID, as FSU must ensure compliance with certain Florida statues. The process is expected to be complete in 2026, after which the MagLab will begin integration of ORCIDs into its systems.

USER SURVEY

The annual MagLab user survey now includes questions related to users' knowledge and implementation of FAIROS practices. By tracking answers to these questions, CFOS will be able to monitor progress on user adoption and implementation of FAIROS practices over time, providing valuable metrics. We intend to modify or add questions over time as appropriate. A more comprehensive user survey was planned for 2025 but was delayed due to the late implementation of expected changes to the NSF PAPPG related to public accessibility of datasets and published articles. In late 2025/early 2026, NSF released PAPPG supplements that finally implemented these long-expected changes. Survey questions for 2026 will specifically ask users about their familiarity with these new requirements, allowing the MagLab to tailor its efforts accordingly.

5 PUBLICATIONS

5.1 PEER-REVIEWED PUBLICATIONS

The Laboratory continued its strong record of publishing, with **412** articles appearing in peer-reviewed scientific and engineering journals in 2025. Among these, **356** acknowledge NSF support for the operation of the NHMFL, and **181** (44 percent) appeared in significant journals. **Table 5.1.1** provides an overview of NSF-acknowledged peer-reviewed and significant peer-reviewed publications by division then non-NSF-funded units.

Table 5.1.1. *Submitted peer-reviewed publications from the OPMS live database. The point-in-time snapshot was on March 18, 2026. A total number of publications per year should NOT be drawn from this report because a submitter may, as appropriate, link a publication to two or more facilities. We note that the State of Florida contributes significantly to NHMFL and hired faculty at UF and FSU to enhance NHMFL programs. Publications from these professors are included as they significantly enhance the NHMFL research effort and are listed here in the UF physics and CMT/E categories.*

5.3 PRODUCTS (5)

Authors	Title	Product Information	Facilities
Hu, Y.; Chen, Y.; Oyekunle, I.P.	*Solid oxide electrolytes and methods for making the same*	US Patent application US20250158114A1	NMR Facility
Markiewicz, W.D., Bird, M.D., Dixon, I.R., Marshall, W.S., Painter, T.A., Xu, P.	*Symmetric quench protection of resistive insulation coils*	US12347612B2	MS & T
Ogbolu, B.; Hu, Y.; Gamaralalage, T.D.	*High-performance sodium ion electrolytes and efficient methods for making the same*	US Patent number US12304827B2 awarded 5/20/2025	NMR Facility
Oyekunle, I.P.; Truong, E.; Poudel, T.P.; Hu, Y.	*Sulfide electrolytes and efficient methods for making the same*	US patent application US20250171325A1	NMR Facility
Poudel, T.P.; Hu, Y.; Oyekunle, I.P.	*Solid electrolytes and methods for making the same*	US Patent application number US20250171327A1	NMR Facility

5.4 DEGREES

M.S. DEGREES (7 LOCAL/1 EXTERNAL)

Authors	Titles	MagLab Facilities	University	Degrees
Bell, Celicia	*White matter in pain and aging*	MBI-UF	UF	M.S. (local)
Bryant, Hannah	*Evaluation of Sodium Redistribution in Preclinical Stroke Models: A Triple Quantum MRI Approach*	NMR Facility	FSU	M.S. (local)
Kamadana, Krishna Saketh	*Development of Computational Tools for Top-Down Proteomics*	ICR Facility	FSU	M.S. (local)
Lopez, Mariana	*[Title not available]*	AMRIS Facility at UF	UF	M.S. (local)
Priester, Shane	*[Title not available]*	AMRIS Facility at UF	UF	M.S. (local)
Radovich, Jenna	*Sodium MRI at 21.1 T to Evaluate Longitudinal Sodium Function in an Animal Model of Aging and Alzheimer's Disease*	NMR Facility	FSU	M.S. (local)
Thomason, Riley	*Tracing Storm Runoff from Hurricane Idalia in Two Springs in North Florida Using Oxygen and Hydrogen Isotopes*	Geochemistry Facility	FSU	M.S. (local)
Ofori, Lovia	*High-Frequency Electron Paramagnetic Resonance in the Kagome-lattice YMn_6Sn_6 crystal*	EMR Facility	University of Texas at El Paso	M.S. (external)

PH.D. DEGREES (19 LOCAL/8 EXTERNAL)

Authors	Titles	MagLab Facilities	University	Degrees
Bhagu, Jamini	*Magnetic Resonance Imaging and Spectroscopy-based Evaluation of Biotherapeutics*	NMR Facility	FSU	Ph.D. (local)
Boloki, Omar	*Fundamental Understanding of Gas Transport in Novel Hybrid Membranes and Porous Materials via Pulsed Field Gradient NMR*	AMRIS Facility at UF	UF	Ph.D. (local)
Chang, Mario	*Investigating Cancer Metabolism and Therapeutic Efficacy with Stable Isotope Tracer Methods*	AMRIS Facility at UF	UF	Ph.D. (local)
Dowdell, Zachary	*Advancing Crystal Engineering through Mechanochemistry: Synthesis and Solid-State NMR of Pharmaceutical Salts, Cocrystals, and Integrative Solid Forms*	NMR Facility	FSU	Ph.D. (local)
Fleischer III, Carl	*Applications of Quadrupolar Nuclear Magnetic Resonance Crystallography Guided Crystal Structure Prediction*	NMR Facility	FSU	Ph.D. (local)
Guzman, Clemente	*Combining SQUID Devices and Microwave Resonators for Coherent Control and Detection of Quantum Spins*	CMT/E	FSU	Ph.D. (local)
Jindal, Vishwas	*[Title not available]*	MBI-UF	UF	Ph.D. (local)
Johnson, Reece	*Surface-supported heterogeneous niobium catalysts for hydrocarbon transformations*	AMRIS Facility at UF	UF	Ph.D. (local)
Kimball, James	*New Methods for Signal Enhancement in Solid-State NMR*	NMR Facility	FSU	Ph.D. (local)
Marshall, Erin	*[Title not available]*	AMRIS Facility at UF	UF	Ph.D. (local)
McCadden, Caitlin	*Discovery of novel terpene synthases and characterization of oxidative transformations in diterpenoid biosynthesis*	AMRIS Facility at UF	UF	Ph.D. (local)
Moore, Andrew	*Identification of prospective predictors of alcohol initiation during early adolescence*	MBI-UF	UF	Ph.D. (local)
Olsen, Stine	*Unveiling marine natural products from cold-water organisms*	AMRIS Facility at UF	UF	Ph.D. (local)
Pabbathi, Smitha	*Investigating the human GPCR ineractions with G protein and allosteric modulators from a structural perspective*	AMRIS Facility at UF	UF	Ph.D. (local)
Ratajska, Adrianna	*Cognition in Essential Tremor: A neuroimaging and biomarker study*	MBI-UF	UF	Ph.D. (local)
Ray, Arka	*Membrane lipids regulate functioning of G protein-coupled receptors*	AMRIS Facility at UF	UF	Ph.D. (local)
Rushin, Anna	*[Title not available]*	AMRIS Facility at UF	UF	Ph.D. (local)
Schundelmier, Benny	*Exploring Quantum Materials for Improving Thermoelectric Properties and Discovering Novel Characteristics*	DC Field Facility	FSU	Ph.D. (local)

Authors	Titles	MagLab Facilities	University	Degrees
Simon, Zachary	*Amyloid-β and apolipoprotein-ε4 differentially affect functional connectivity and network topology in murine models of Alzheimer's disease risk factors*	AMRIS Facility at UF	UF	Ph.D. (local)
Acharya, Gokul	*Synthesis and Properties study of Layered Magnetic Topological Materials*	DC Field Facility	University of Arkansas	Ph.D. (external)
Agarwal, Shiva	*Probing Shielding Tensor Components of Amino Acids Using Nuclear Magnetic Resonance*	NMR Facility	Western Michigan University	Ph.D. (external)
Azizivahed, Tahereh	*Solid-State NMR Study of Adsorption and Selectivity in Metal-organic Frameworks*	NMR Facility	The University of Western Ontario	Ph.D. (external)
Díaz-Sánchez, Luis	*MALDI-MS analysis of biomarkers in phytoplankton*	ICR Facility	Universidad Industrial de Santander	Ph.D. (external)
Lamahewage, Sujeewa	*Expanding the frontiers of solid-state NMR spectroscopy: Techniques and applications for quadrupolar nuclei and structural analysis*	EMR Facility, NMR Facility	iowa state university	Ph.D. (external)
Xu, Jiabin	*Local Structural Characterization of Metal-Organic Frameworks and Their Multifaceted Applications*	NMR Facility	The University of Western Ontario	Ph.D. (external)
Zadorozhnyi, Roman	*Structural Basis of HIV-1 Inhibitor Activity, and Resistance, and Characterization of Active Pharmaceutical Ingredients in Drugs and Microcrystalline Proteins by Multinuclear Magic Angle Spinning NMR Spectroscopy*	EMR Facility	University of Delaware	Ph.D. (external)
Zhang, Wanli	*Characterization of Metal-organic Frameworks via Wideline and High-resolution Solid-state NMR Spectroscopy*	NMR Facility	The University of Western Ontario	Ph.D. (external)

APPENDIX 2 – USER FACILITY STATISTICS

OVERVIEW

Seven user facilities — AMRIS (NMR-MRI@UF), DC Field, EMR, High B/T, ICR, NMR-MRI @FSU, and Pulsed Field — each with exceptional instrumentation and highly qualified staff scientists and staff, comprise the magnet lab's user program. In this appendix, each facility presents detailed information about its user demographics, operations statistics and requests for magnet time. A user is an individual or a member of a research group that is allocated magnet time. The user does not have to be "on site" for the experiment. A researcher who sends samples for analysis; a scientist who uses new lab technologies to conduct experiments remotely; or a PI who sends students to the magnet lab, are all considered users. All user numbers reflect distinct individuals, i.e., if a user has multiple proposals (different scientific thrusts) or is allocated magnet time more than once during the year, he/she is counted only once.

AMRIS FACILITY

Table 1a. *Users by Participation – NSF-Funded*

	Users	Users Present	User Present Virtually	Users Operating Remotely	Users Sending Sample	Off-Site Users
Senior Personnel, U.S.	49	45	0	0	0	4
Senior Personnel, non-U.S.	5	2	0	0	0	3
Postdocs, U.S.	11	10	0	0	1	0
Postdocs, non-U.S.	0	0	0	0	0	0
Students, U.S.	40	39	0	0	0	1
Students, non-U.S.	1	0	0	0	0	1
Technician, U.S.	6	6	0	0	0	0
Technician, non-U.S.	0	0	0	0	0	0
Total	**112**	**102**	**0**	**0**	**1**	**9**

[1] Users using multiple facilities are counted in each facility listed.
[2] "Users Operating Remotely" refers to users who operate the magnet system from a remote location. Remote operations are not currently available in all facilities.
[3] "Users Sending Sample" refers to users who send the sample to the facility and/or research group and the experiment is conducted by other collaborators on the experiment. Users at UF, FSU, and LANL cannot be "sample senders" for facilities located on their campuses.
[4] "Off-Site Users" are scientific or technical participants on the experiment; who will not be present, sending sample, or operating the magnet system remotely; and who are not located on the campus of that facility (i.e., they are off-site).

Table 1b. *Users by Participation – Non-NHMFL Funded*

	Users	Users Present	User Present Virtually	Users Operating Remotely	Users Sending Sample	Off-Site Users
Senior Personnel, U.S.	51	34	0	0	0	17
Senior Personnel, non-U.S.	0	0	0	0	0	0
Postdocs, U.S.	15	15	0	0	0	0
Postdocs, non-U.S.	0	0	0	0	0	0
Students, U.S.	82	63	0	0	0	19
Students, non-U.S.	1	1	0	0	0	0
Technician, U.S.	7	7	0	0	0	0
Technician, non-U.S.	0	0	0	0	0	0
Total	**156**	**120**	**0**	**0**	**0**	**36**

Table 1c. *Users by Participation – Summary*

	Users	Users Present	User Present Virtually	Users Operating Remotely	Users Sending Sample	Off-Site Users
NSF Funded	**112**	102	0	0	1	9
Non-NHMFL Funded	**156**	120	0	0	0	36

Technician, non-U.S.	0	0	0	0	0	0	0

	Users[1]	External Users	Local Users[2]	NHMFL-Affiliated Users[2,3,4]	Laboratory[3,5]	University[4,5]	Industry[5]
Total	**112**	**45**	**53**	**14**	**1**	**110**	**1**

[1] Users using multiple facilities are counted in each facility listed.
[2] NHMFL-Affiliated users are defined as anyone in the lab's personnel system (i.e., on our website/directory), even if they travel to another site. Local users are defined as any non-NHMFL-Affiliated researchers originating at any of the institutions in proximity to the MagLab sites (i.e., researchers at FSU, UF, FAMU, or LANL), even if they travel to another site.
[3] Users with primary affiliations at NHMFL/LANL are reported in NHMFL-Affiliated Users and National Laboratory.
[4] Users with primary affiliations at FSU, UF, or FAMU are reported in NHMFL-Affiliated Users and National University.
[5] The TOTAL of university, industry, and national lab users will equal the TOTAL number of users.

Table 2b. *Users by Organization – Non-NHMFL Funded*

TOTAL	**544**	**308**	**19**	**0**	**28**	**189**

[1] Users using multiple facilities are counted in each facility listed.
[2] "Users Operating Remotely" refers to users who operate the magnet system from a remote location. Remote operations are not currently available in all facilities.
[3] "Users Sending Sample" refers to users who send the sample to the facility and/or research group and the experiment is conducted by other collaborators on the experiment. Users at UF, FSU, and LANL cannot be "sample senders" for facilities located on their campuses.
[4] "Off-Site Users" are scientific or technical participants on the experiment; who will not be present, sending sample, or operating the magnet system remotely; and who are not located on the campus of that facility (i.e., they are off-site).

Table 2. *Users by Organization*

	Users[1]	External Users	Local Users[2]	NHMFL-Affiliated Users[2,3,4]	Laboratory[3,5]	University[4,5]	Industry[5]

TOTAL	**544**	**439**	**27**	**78**	**56**	**468**	**20**

[1] Users using multiple facilities are counted in each facility listed.
[2] NHMFL-Affiliated users are defined as anyone in the lab's personnel system (i.e., on our web site/directory), even if they travel to another site. Local users are defined as any non-NHMFL-Affiliated researchers originating at any of the institutions in proximity to the MagLab sites (i.e., researchers at FSU, UF, FAMU, or LANL), even if they travel to another site.
[3] Users with primary affiliations at NHMFL/LANL are reported in NHMFL-Affiliated Users and National Laboratory.
[4] Users with primary affiliations at FSU, UF, or FAMU are reported in NHMFL-Affiliated Users and National University.
[5] The TOTAL of university, industry, and national lab users will equal the TOTAL number of users.

[1] Each 20MW resistive magnet requires two power supplies to run, the 45T hybrid magnet requires three power supplies, and the 36T Series Connected Hybrid requires one power supply. Thus, there can be four resistive magnets + three superconducting magnets operating or the 45T hybrid, series connected hybrid, two resistive magnets and three superconducting magnets. User Units are defined as magnet days. Users of water-cooled resistive or hybrid magnets can typically expect to receive enough energy for 7 hours a day of magnet usage, so a magnet day is defined as 7 hours. Superconducting magnets are scheduled typically 24 hours a day.

TOTAL	**155**	**42**	**0**	**0**	**37**	**76**

[1] Users using multiple facilities are counted in each facility listed.
[2] "Users Operating Remotely" refers to users who operate the magnet system from a remote location. Remote operations are not currently available in all facilities.
[3] "Users Sending Sample" refers to users who send the sample to the facility and/or research group and the experiment is conducted by other collaborators on the experiment. Users at UF, FSU, and LANL cannot be "sample senders" for facilities located on their campuses.
[4] "Off-Site Users" are scientific or technical participants on the experiment; who will not be present, sending sample, or operating the magnet system remotely; and who are not located on the campus of that facility (i.e., they are off-site).

Table 2. *Users by Organization*

	Users[1]	External Users	Local Users[2]	NHMFL-Affiliated Users[2,3,4]	Laboratory[3,5]	University[4,5]	Industry[5]

TOTAL	**225**	**85**	**0**	**24**	**37**	**79**

[1] Users using multiple facilities are counted in each facility listed.
[2] "Users Operating Remotely" refers to users who operate the magnet system from a remote location. Remote operations are not currently available in all facilities.
[3] "Users Sending Sample" refers to users who send the sample to the facility and/or research group and the experiment is conducted by other collaborators on the experiment. Users at UF, FSU, and LANL cannot be "sample senders" for facilities located on their campuses.
[4] "Off-Site Users" are scientific or technical participants on the experiment; who will not be present, sending sample, or operating the magnet system remotely; and who are not located on the campus of that facility (i.e., they are off-site).

Table 2. *Users by Organization*

	Users[1]	External Users	Local Users[2]	NHMFL-Affiliated Users[2,3,4]	Laboratory[3,5]	University[4,5]	Industry[5]

Technician, non-U.S.	0	0	0	0	0	0	0
TOTAL	**225**	**146**	**35**	**44**	**16**	**209**	**0**

[1] Users using multiple facilities are counted in each facility listed.
[2] NHMFL-Affiliated users are defined as anyone in the lab's personnel system (i.e., on our web site/directory), even if they travel to another site. Local users are defined as any non-NHMFL-Affiliated researchers originating at any of the institutions in proximity to the MagLab sites (i.e., researchers at FSU, UF, FAMU, or LANL), even if they travel to another site.
[3] Users with primary affiliations at NHMFL/LANL are reported in NHMFL-Affiliated Users and National Laboratory.
[4] Users with primary affiliations at FSU, UF, or FAMU are reported in NHMFL-Affiliated Users and National University.
[5] The TOTAL of university, industry, and national lab users will equal the TOTAL number of users.

Postdocs, non-U.S.	**50**	13	2	0	4	31
Students, U.S.	**513**	351	1	8	25	128
Students, non-U.S.	**87**	34	1	0	18	34
Technician, U.S.	**39**	27	0	0	0	12
Technician, non-U.S.	**2**	1	0	0	0	1
TOTAL	**1,637**	**807**	**19**	**26**	**122**	**663**

[1] Users using multiple facilities are counted in each facility listed. If a user has multiple participations within the facility, it does not double count, instead reports the first occurrence in the following order: *User Present* takes precedence over *User Present Virtually*, next *User Operating Remotely*, and *User Sending Sample* and *Off-Site User* has the least precedence.
[2] *User Present:* This person will be physically present in the MagLab user facility during the experiment.
[3] *User Present Virtually:* This person will participate virtually in the data acquisition process under the control of present MagLab user support personnel. Users at FSU, LANL, and UF cannot be "User Present Virtually" for facilities located at their campuses.
[4] *User Operating Remotely:* This person will be operating the magnet system from a remote location. Remote operations are not currently available in all facilities.
[5] *User Sending Sample:* This person will be sending the sample and the experiment will be conducted by in-house user support personnel. Users at FSU (except ICR), LANL, and UF cannot be "sample senders" for facilities located at their campuses.
[6] *Off-Site User:* This person is a scientific or technical participant on the experiment, but will not be present, sending samples, operating the magnet system remotely nor be present virtually.

[1] Users using multiple facilities are counted in each facility listed.
[2] NHMFL-Affiliated users are defined as anyone in the lab's personnel system (i.e., on our website/directory), even if they travel to another site. Local users are defined as any non-NHMFL-Affiliated researchers originating at any of the institutions in proximity to the MagLab sites (i.e., researchers at FSU, UF, FAMU, or LANL), even if they travel to another site.
[3] Users with primary affiliations at NHMFL/LANL are reported in NHMFL-Affiliated Users and National Laboratory.

[4] Users with primary affiliations at FSU, UF, or FAMU are reported in NHMFL-Affiliated Users and National University.
[5] The total of university, industry, and national lab users will equal the total number of users.

TOTAL	**8,980.8**	**4,951.4**	**1,171.6**	**1,484.7**	**1,373.1**

[1] User Units are defined as magnet days; time utilized is recorded to the nearest 15 minutes. Magnet day definitions for AMRIS instruments: Verticals (500, 600s, & 750MHz), 1 magnet day = 24 hours. Horizontals (4.7 and 11.1T), 1 magnet day = 8 hours. This accounts for the difficulty in running animal or human studies overnight. Magnet days were calculated by adding the total number of real used for each instrument and dividing by 24 (vertical) or 8 (horizontal). Note: Due to the nature of the 4.7T and 11T studies, almost all studies with external users were collaborative with UF investigators.
[2] Each 20MW resistive magnet requires two power supplies to run, the 45T hybrid magnet requires three power supplies, and the 36T Series Connected Hybrid requires one power supply. Thus, there can be four resistive magnets + three superconducting magnets operating or the 45T hybrid, series connected hybrid, two resistive magnets and three superconducting magnets. User Units are defined as magnet days. Users of water-cooled resistive or hybrid magnets can typically expect to receive enough energy for 7 hours a day of magnet usage, so a magnet day is defined as 7 hours. Superconducting magnets are scheduled typically 24 hours a day.
[3, 4, 5, 6] User Units are defined as magnet days. One magnet day is defined as 24 hours in superconducting magnets.
[7] User Units are defined as magnet days. Magnets are scheduled typically 12 hours a day.
[8] Days to external users at facility => all U.S. University, U.S. Govt. Lab., U.S. Industry, Non-U.S. excluding NHMFL Affiliated, Local, Test, Calibration, Set-up, Maintenance, Inst. Dev.
[9] Days to local => local only
[10] Days to NHMFL-Affiliated (in-house) research => NHMFL-Affiliated only
[11] Days to instrument development and maintenance (combined) => Test/Calibration/ Maintenance, Method Development, Analytical Chemistry, Upgrade Cell Design/Hardware Setup, Repair
